> Not long ago, prospective Hams were being promised free Internet access by the "PR" types, never got it because it had always been illegal from the get-go, and as a result we ended up with a large pool of dissatisfied new Hams, brought into the hobby on the strength of a false PR claim.

I have no idea what this is in reference to. What free Internet access?

> Being bad PR, it highlights systems that nothing appreciable has been accomplished with, ignoring the excellent, large-scale US packet networks that actually exist and operate every day. The people who have actually accomplished something with packet radio are systematically ignored. These systems are downplayed so new Hams can be "sold" into the hobby on the strength of something that has yet to see any significant use. - A sure prescription of disappointment and disallusionment. - Again.

How many non-amateur licensees really even know about a packet network? Even my relatives who know that amateur radio exists, that I have a license, and that I have "a computer on the air" probably don't realize that it may be part of a network of computers.

> Unfortunately, most new and prospective Hams are thorougly exposed to this "tabloid" side of the hobby and so are starved for facts. The rational, scientific aspect of the hobby, and our most outstanding accomplishents are seldom presented to them.
>
> Too boring! - the PR guys say. Don't scare new Hams away by talking about

> what Hams actually tend to do with radio!
>
> The 802.11 stuff is kind of neat, but is severley limited by both federal law, and the laws of physics. There are obvious uses for 802.11, but using it as a basis for a "PR" campaign for the hobby is a good way to shoot off our own foot, disallusioning a large group of new Hams. - Yet again!

What is disillusioning is that the ARRL claims to have taken the lead on this concept. Bullsh-t. There were those who were doing this sort of thing way before LAST YEAR when the ARRL first even thought of it.

I figured out a simple way to use a PSK31 soundcard program's waterfall display as a tuning indicator for HF packet TNC's that have no built-in indicator.

It's cheap, it works, it's a lot better than trying to do it by "ear".

It's actually easier and faster to use than most built-in tuning indicators!

http://www.uspacket.net/hfpkt.htm

... Or go to USPN, click the "Tutorials" page, and pick it from the list
there.

I am an enginnering graduate doing a training in VLSI.
Could any body please help me in understanding the implementation of
modulation technique within the digital domain.I will explain my doubt.
For DQPSK modulation,we take a dibit and depending upon the phase (jw)
we taransmit those bits in I-phase and Q-phase. I phase holds the real
value and Q phase hlds the Imaginary part.
NOw the Real values can be -1, +1 ,0. Do we have to take 2s complement
arithmetic for representing this. But that again needs 2 bits.
So I would like to know how these bits are sent? Or I would liek to
know if my idea is wrong ?
Could any body please help me ..
Thanks !!

Take a look at:

http://cvs.sourceforge.net/cgi-bin/viewcvs.cgi/*checkout*/spuc/spuc/comm/dqpsk.h?rev=1.1

(the above may wrap, so link it back together on your browser line).

Hello Tom.

I have no knowledge of the TM-255, so I can't help there. But I can tell you that the KPC-3's data port is a standard RS-232 DCE port. That's the 25-pin connector. The 9-pin connector is audio interface and a pinout is available at http://www.kantronics.com/kpc3+.htm (should also work for KPC-3).

HI Jim,
Yaah it looks useful,But as i am an VLSI guy so i am finding it bit
difficult to understand the C and C++. Do you have the idea of any
reference document or any codes in HDL (VHDL/ VERILOG) regarding this
?? Then it will be very much help full for me..
Thanks Jim for your kind response.

Was it really neccessary to spam this on all the amateur radio groups? If your
link has anything to do with Amateur radio, rec.radio.amateur would have been
sufficient.

I've read that some of the later TNC's include APRS. Apparently they
connect to a computer to be configured, then all they need is a GPS
receiver and radio to become an APRS station. (Makes sense -- the TNC
contains everything needed.)

So, which models of TNC have this feature? I have a PacComm Tiny-2, and
I'm pretty sure it does not. Is there a firmware upgrade (or replacement)
for the Tiny-2?

Thanks.

At least some of the KANTRONICS TNC's have APRS features in built. The 9612+ TNC's i have been using for a while do, and the second-hand KAM98 that I recently acquired appears to have the same features.

I am not aware of any TNC-2 eprom with the APRS features.

That's the old way of doing things. Today you buy a tracker (single board PIC processor), hook that to your GPS, and radio, and then throw it under the spare tire.

In the house, I recommend AGWPE (packet engine) and use the soundcard modem. Every Ham I know has an old PC and sound card to make up an APRS station. Then get the UI-View software and you're done.

TNC's, even if they are free, will be less than the station described above. The trackers have neat features that transmit your position as you make a turn. TNC's just beacon. The AGW soundcard driver works great, even on XP.

I'm reviving my Packet gear on 2M for AX25 1200 baud service
and later some APRS.
My TNC seems to be not working correctly.
Another possibility I do not have it setup correctly.
Some info from 1274 USERS would sure help.

I am running a ver 1.2.7 firmare.
My TNC is rigged for 1200 baud as best I can tell.
JMPR 8 and 5 are in place. All others JMPR are not shorting any pins

The Modem disconnect header is jumper for internal modem.
Running port to PC at 9600 allows me to control the TNC
from keyboard using Hypertem in WIN98SE. Will try another
Packet program like YAPP.

Digital Loopback works OK. Can CONNECT to W6MIK and echo keyboard typing.
Tones are heard on another HT when CAL is typed
and see 10W into dummy load.
Tones changed with space bar.

I hear packets and see tone bursts on scope at 144.39 and 144.95
in Van Nuys, CA. DCD light flashes on every time I hear a BRACK.
But not any decode info is every painted on screen.
Also the LED Tuning Unit Display NEVER ever has any segment lighted.
In VHF mode, should the any LED segments be lighted?

Ran an APRS software with same result,
nothing is ever painted on screen.

Ran an alignment procedure for this TNC.
Tone calibration part of the procedure worked OK
Expected tones were very close to 1200, 200, 1600 and 1800.]
Portion of procedure that DID NOT work
was square wave adjustment and TUNING UNITs LED segments NEVER
tuned on. Square wave was on wrong pin of JMPR.

Will APRS packet info ever paint ANYTHING on screen
when running AX25 Packet software such as YAPP?
In VHF packet mode, should LED segments EVER be on?

Is there any reason why my MFJ1274 TNC might not work with APRS?

I will feed packet received info from another radio
into this TNC to see if radio is at fault but I suspect the TNC.

What might help would be to run my 1274 TNC on another AX25 Packet
station that also uses a 1274.

Many thanks in advance for any hints.

73, W6MIK, Dave

Hi there fellow warblers and finger talkers happy to announce that MixW version 2.08 is now supporting PSK63 mode. You may download the latest version dated May 26th from our website which is www.nvbb.net/~jaffejim/mixwpage.htm Please make sure you download the new Help files dated April 11 2003 they reflect a full revision fully supporting version 2.07 please read the information regarding PSK63 (BPSK63) and the Macros that make it work. Also read the Changes page and if I were you I would print out the entire page which will give you an insight as to how the program has progressed and works.. Best 73 and happy finger talking and warbling.. Jim, WA2VOS

Hi,

I am trying to get my Red Hat 8.0 box working as a aprs digipeater.
I have the user-level soundmodem package working ok, and the
aprsdigi software is working.

My problem is PTT. I am attempting to use the parallel
port. No joy so far. A multimeter between PTT and ground
show no change when running soundmodemconfig PTT test, or
when running aprsdigi.

I built the parallel port circuit from Sailor's web page.

web searching, I see where people doing this with serial
port have to turn off the port using setserial. Is there
some similar thing that must be done for parallel?

Help!

Chris

Maybe try different parallel port modes in the CMOS (old style
XT probably best).

You should not have the line printer driver loaded (rmmod lp).

I am currently using an FT-100D for packet, but I'd like to get a seperate data
rig for connecting to the local cluster node. Can anyone recommend a simple
radio for this use? It doesn't have to have all the "bells and whistles" of a
modern rig, just needs to be able to tune to 144.930 simplex.

For new equipment, MFJ has a digital only radio for about $139. AES had the Yaesu FT1500M on sale for about the same price, but it seems to have jumped up to $200. A friend has used 3 of the Yaesu rigs for a voice and packet network with great success.

I have a 1500 and I like it. You can actually operate it without a
manual :-)

The only caution is to grab it by the wires when you bring it into
the house at night, because the case is the heat-sink, and you will
burn yourself if you were chatting on the way home.

About 5 of us bought one when they first came out, at $120 on sale,
and after a year, everyone still has them and they are a workhorse.
I'm using mine mostly for APRS, but it switches to voice with no
problems.

I tried DigiPan first. It is a good package for getting your feet wet.
Easy to set up and easy to tune to transmissions. Logging is a little weak.

I am now trying DXLab (http://www.qsl.net/dxlab/) which is an interesting
suite of tools, including WinWarbler, a logging program that links to
eQSL.cc, a transciever controller, etc.

Your mileage may vary.

Bob Furzer has released the beta version of his 32 bit logging software, and
I have it on my web page for those who may wish to download it. There is a

choice of downloads, one file, or four smaller files.

I have a number of other softwares on the page too so you may want to take a look see....or not as the case may be :-)

http://g3vfp.org/download.html

Cheers

Dave G3VFP

Well, seems the FT-1500 is popular. I have one in the car.. :)

I actually found out that the packet cluster is full quieting into my VX-5R from inside the shack with the stock antenna, so I bought the packet cable for that and will be using the HT to monitor the packet cluster. Thanks for the replies, though!

Hello all. I have a VX-5R HT that I will be using for packet. I tuned the local packet cluster and found that if I keep the HT in FM-Narrow, it sounds like the data is being "clipped". If it's in WFM mode, I seem to hear the entire data stream.

Does anyone have any experience using the VX-5R for packet? Any ideas on the NFM and WFM modes?

A new tutorial on setting up and operating Soundcard Packet with FlexNet is available at the USPN web-site: http://www.uspacket.net   in the Links section, under "Packet Software", or you can go directly to this link:

http://uspacket.net/flex32/flx_32.htm

Stand by for a bit of load-up time on this page, as there are numerous screen-shots that show every detail of setting up the software and getting on the air.

To whom it shall concern:

It has been years since I have played on packet radio, so I recently dug out my olde KAM, which by the way has firmware version 2.84!?! I am in desperate need for some upgrades for the unit!!! Any advice on where to get a firmware upgrade for a version greater than 2.84 would be very appreciated!

I am also looking for a KAM Enhancement Board!

I spoke with a friend of mine whom told me the firmware in the KAM is not public domain, therefore my understanding is that the only way I can ask someone to email me a copy of the firmware is if it a version that you paid for and are no longer using due to your unit being broken or a version you are no longer using that you paid for, since you have upgraded to a later verion of the firmware. I am looking for anything greater than 2.84, but 8.2E would be the most optimal to receive. I do own an EPROM programmer so an image is fine. Obviously if you are sending me the firmware via email, a notice indicative of your transfer of the license to me would have to be included with the image I imagine. I am trying to locate a copy of the firmware legally, though I suppose there is little I can do if someone just sends it.

The big problem is that Kantronics doesnt seem to want to help people with olde KAMs anymore, so I am left to my own devices to find what or how I can upgrade the unit!

Here are some of my questions:

What is the compatible version E2PROM (EEPROM) to use instead of a 27C512 EPROM?

What EEPROM/E2PROM will work to replace the 27C512 in the KAM?

Is 8.2E the latest firmware the KAM that I could have if an Enhancement Board is installed in the KAM?

What is the latest version of the firmware for the KAM that works if you do NOT have an Enhancement Board?

I understand there was a memory upgrade, can anyone tell me about that upgrade?

I also understand there was a clock upgrade, can anyone tell me about that upgrade?

Is there a place I can get a PDF or digital copy of the KAM manual, KAM Enhancement Board manual, or DVR 2-2 manual?

What can I do to upgrade or enhance my DVR 2-2 to make it work better?

Does anyone know what I must do to align or setup the DVR 2-2 if I want to add a second channel/crystal to it?

Where do I get crystals and of what type for the DVR 2-2?

Please carbon copy my email address on all replies if you can.

Thanks in advance,

Stuart

You say: "The big problem is that Kantronics doesnt seem to want to help
people with
olde KAMs anymore, so I am left to my own devices to find what or how I can
upgrade the unit! (sic)"

Interesting. KAM manuals and BIOS flash upgrades are available for download
on their site.

Maybe if you visited their web site and contacted them:
http://www.kantronics.com/index.htm

Joe S.:

Unless I am mistaken, the only software and manuals they have on their site right now are for the KAM Plus and KAM XL. Those of us with the olde KAM do not seem to be getting the privledge of a software EPROM or manual to download.

Have I missed something, or did you find the 8.2E or other firmware for the Enhanced Board or KAM there?

Stuart

Linux Packeting Amateurs:

I am running RedHat 9.0, and I have compiled my kernel with support for AX25 built into the kernel (not as a module), when I boot up it is my understanding I should see some entries in /proc/sys/net/ax25; I do not. Any ideas?

Stuart

Have you defined any interfaces?  Do they show up when you run
ifconfig?

Hello ,

Who can give me the pin layout for the datacable between the KPC3 and the
TM255 (at the back of this Rig) ?

Many thanks

Tom

That is correct -- The only devices supported by the web page are:

    KAM-98
    KAM-XL
    KPC-3+
    KPC96/12

The KAM+ is no longer discussed or supported on their web page.  I
left an email with their tech support to see if they have the latest
firmware or hardware for the KAM+.

  We'll see if they even respond.

Tony -- KF3BX

The entries I see in there are directories, each named for an interface (in my case, ax0 ... ax3). That implies to me that you have to attach the soundcard interface before you will seen an entry.

The easy answer is "almost any rig" that has a PTT line and enough
dissipation. As digital isn't all that demanding a 20 to 50 watt rig even
with a small heatsink will most likely work.

> firmware or hardware for the KAM+.

This seems rather silly to me on their part. To put up a scanned copy of the manuals in PDF format, and the last firmware that they made available for the KAM/KAM PLUS would be a reasonable thing to do, even if they declare there is no support from them for any of the documentation or firmware.

As I return to packet radio and look at their new products, it leaves me with a rather bad taste in my mouth to know that they will not do anything whatsoever to help olde customers when they have all the software and manuals right there to assist people. I find it to be a very arogant point of view for them to take. Now maybe if they get enough requests they will change that, but at this point I emailed someone; somehow they came to the conclusion that they did not want to support KAM or KAM PLUS.

IF that's how one gets a soundcard interface attached, then yes. I don't have
experience with soundcards as TNC's. The problem is with your driver.

I found his link on the web but its all in German and could'nt find
an email address.

Does anyone here know the email address for DL8MBT.
I got to his website but its all in German so could'nt figure out his
email addr or if he has one. His url is
http://www.radlherr.de
He was a pioneer in creating software for Packet radio and Baycom
systems as well as Digicom.

Hi Terry and Joe,

Just a quick note to inform you that Corinne's mom passed away on Wed Apr 23, 2003.

She had a bout with breast cancer. Radiation apparently killed off all signs of cancer in the breast. But other tests indicated a cancer was still somewhere in her system.

She was hospitalized about 4 weeks ago. After complaints of stomach pain. Subsequent checks did not show anything. But she was not a cooperative patient. Did fight and refuse tests and treatments.

Than was transferred to a nursing facility. In the meantime Corinne and her sisters found a great facility that reminded me of a resort. Corinne and Laverne moved a lot of her stuff from her mobile home like bed, dressers, decor etc. She was there about a week when the nurse called Corinne and said she thought her mom needed to be hospitalized due to dehydration and she was not eating. This was on Monday 4/21/03.

We went there and arranged transport to a local ER in Sun City. The hospital admitted her and kept her till Wed. They recommended a move to a hospice facility. This was done late afternoon.

Lois was at this hospice when her mom arrived. The nurse attending to her mom called lois out into the hall and informed her that she did not think mom would make it through the nite. All were called and everyone including great grandkids were there to see her off to join her husband Mack. Who she has been talking about more and more the past six months.

Linda arrived last nite with her youngest.
Left the other three at home with their father.

Love from Bill & Corinne

flori at radlherr.de (see bottom of page)

If this does not work, maybe the guys at info at baycom.de   could help
you.

Gruss,
  Walter

Stuart,

It sounds like you probably have not correctly configured soundmodem.
See section 6.1.5 of the AX25-HOWTO for details on how to do this.

Bob

FYI, I made a decision with Pacterm for Windows to support the KAM-E and
KAM PLUS with 7.0 firmware or later. Current release 1.7 does that.

In version 2.0 of Pacterm for Windows, due later this year, I still plan to
support the KAM-E and KAM PLUS with 7.0 firmware or later.

I even decided to contine to support the KPC-1 with 5.0 firmware. That's
almost a 20 year old TNC. :)

Rick - W4PC

I fully agree, Stuart. They have not responded to the message I left
on their tech support email address, so I guess the KAM+ is an orphan.
Mine has Version 6.1 firmware and no enhancement board. All I have
ever used it for was packet, aprs, & rtty. I have since moved to the
sound card audio & interface for rtty, mfsk, psk, so all that is left
on the KAM is packet/aprs. Actually, with AWGPE, those can be done
with the sound card interface, also - just haven't gotten around to
it.

The only digital modes I'm interested in that require a modem is
PACTOR II & III. That's so I can do Windowlink/airmail. I got my
KAM+ used, at a hamfest for 60 bucks. I'm glad I didn't pay more for
it -- and I'll not buy another.

Good luck.

I am looking for the 4 pin version of the RIGblaster. I do not need the wall wart, cables or the CD, only the unit itself. I you have one for sale, please email me directly.

TIA,

Dave

Hi All,

Just acquired an AMT-1 AMTOR and RTTY decoder made by ICS in the UK during the 1980's. ICS no longer support this unit and so I was wondering if anyone could help with a scan of the manual? I'm mainly interested in using the equipment for FEC (NAVTEX) decoding.

TIA,

Subject: Packet cable for VX-5R
Message-ID: <20030429102207.28141.00000405@mb-m14.aol.com>
Xref: archiver1.google.com rec.radio.amateur.digital.misc:7405

Hello all. I was wondering if there's a packet cable for the VX-5R that already has the TNC end connected. I bought a cable for my FT-100D a while ago and it already had the connector on it. I just bought one for the VX-5R and it's wires on the end. I have neither the equipment nor the skill to properly solder a connector on the end.

A good soldering station and some practice should help that (I'm sure you will have other opportunities to use it in the future). However, K4ABT sells cables for almost any TNC/Radio combination, including the VX-5R. He has cables for Kantronics as well as TNCs which use the 5-pin DIN connector ($14.95):

I am trying to locate a couple of DTMF chips to repair a repeater tone panel. It is using Mitel's MT8860P, MT8865P and MT5087P. Might anybody out there in radio land have a couple of spares? I have tried to locate them from the different suppliers without success. I have found MT8960 and MT8965's but cannot find any info on their replacement possibilities.   Will consider any other numbers that will work. Thanks Don Smith KB6GQA

Hello,

more than year ago, I read an interresting article(s) on the net about some ultra-narrow-band digital mode, but now I can't find them and forgot keywords or name. So I'm asking you, if you do not know about it or something similar.

There an author wrote, he uses some very very narrowband digital modulation, I think, it was alike CCW or PSK31, but with band in order of 1 Hz (or bit less or more), and of course a very slow bitrate. But he wrote, he can communicate with a very low power pocket batteries (and it seems also a very bad antenna) across thousand kilometers, when he is on journey, and his wife can read at home messages, which he has sent.

So, please, if you know about some papers about these modes, using
bandwidth in order of hertz/milihertz, or any keywords for search, please
tell me.

Thank you,
Marek P.

Hello People....Does anyone have any really solid information as to what is happening with dropping the code Proficiency test to be able to operate on all the HF Bands in a phone mode!! From the input I received so far it would appear that after this ITU meeting takes place...most all the countries will be in agreement for dropping the cw portion of the Licenseing exam...to be able to operate the High Frequencies via a phone mode.....If I'm not mistaken...I think this meeting is coming up, sometime this summer???

Any and all info that has some solidary to it would be greatly appreciated....

Thanks a Lot
Carl

Please don't post this to every amateur radio newsgroup.  Just post it =
to the more relevant ones.  This particular group is about digital modes =
(packet, PSK31, etc) NOT morse code or general operating or policies.

It is on the agenda but there is no guarantee that they will get around =
to voting on it.  The agenda is quite lengthy and they don't get to =
everything.  This has happened before.  Until there is a vote, there is =
no way to even guess what will happen.  Even if the world conference =
votes to drop it, there will be an additional lag for implementation.  =
Also keep in mind that even if the international requirement is dropped, =
each individual country can decide to keep it for their specific =
```

licensing requirements. Some countries have already stated that they =
plan on keeping it no matter what. Here in the US, the FCC would put =
out a Notice for Proposed Rulemaking and allow time for comments. Then =
decide on whether to drop it or not and decide on an implementation =
time.

So don't hold your breath or wait around. It's many months away if it =
happens at all. Instead, learn that 5wpm. It takes about 30 hours for =
the average person to achieve this. Some take less, some take more. So =
get one of the good computer programs, practice an hour a day (break it =
into 15 to 30 minute sessions though for best results) and you could be =
on the air in a few weeks instead of waiting months or even years.

With the sunspot cycle heading downhill, good conditions on the bands =
will become less frequent. So waiting is wasting time.

Good luck,
Dee D. Flint, N8UZE

don't get to everything.&nbsp; This has happened before.&nbsp; Until =
there is a=20
vote, there is no way to even guess what will happen.&nbsp; Even if the =
world=20
conference votes to drop it, there will be an additional lag for=20
implementation.&nbsp; Also keep in mind that even if the international=20
requirement is dropped,&nbsp;each individual country can&nbsp;decide to =
keep it=20
for their&nbsp;specific licensing requirements.&nbsp; Some countries =
have=20
already stated that they plan on keeping it no matter what.&nbsp; Here =
in the=20
US, the FCC would put out a Notice for Proposed Rulemaking and allow =
time for=20
comments.&nbsp; Then decide on whether to drop it or not and decide on =
an=20
implementation time.</FONT></DIV>
<DIV><FONT face=3DArial size=3D2></FONT>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>So don't hold your breath or wait =
around.&nbsp;=20
It's many months away if it happens at all.&nbsp; Instead, learn that=20
5wpm.&nbsp; It takes about 30 hours for the average person to achieve=20
this.&nbsp; Some take less, some take more.&nbsp; So get one of the good =

computer programs, practice an hour a day (break it into 15 to 30 minute =

sessions though for best results) and you could be on the air in a few =
weeks=20
instead of waiting months or even years.</FONT></DIV>
<DIV><FONT face=3DArial size=3D2></FONT>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>With the sunspot cycle heading =
downhill, good=20
conditions on the bands will become less frequent.&nbsp; So waiting is =
wasting=20
time.</FONT></DIV>
<DIV><FONT face=3DArial size=3D2></FONT>&nbsp;</DIV>
<DIV><FONT face=3DArial size=3D2>&nbsp;Good luck,</FONT></DIV>
<DIV><FONT face=3DArial size=3D2>&nbsp;Dee D. Flint, N8UZE</FONT></DIV>
<DIV></FONT>&nbsp;</DIV></DIV></DIV></BODY></HTML>

Soli, meaning solitary.

Dary, misspelling for dairy.

I think he wants information about a lonely milk cow!

USPN: http://www.uspacket.net is proud to announce a detailed, step-by-step tutorial on soundcard packet radio with Flex32, the Windows version of FlexNet.

The article takes you from start to finish, incluing all steps and information necessary in order to get on the air. It includes sections on the soundcard/radio interface, the soundcard modem software, Flex32, and a simple term program, tnc32 that is used to test your installation on the air.

In the sections that describe software setup, extensive use of screen shots show every step, making it much easier to get everything going right, the first try.

The final section tells where you can find FlexNet support by means of either an E-mail list or an Internet forum. It also has a link to Paxon, an excellent packet terminal that is optimized for use with FlexNet and offers many useful and fun features.

As is mentioned in the tutorial, Flex32 is "the best of the best" for soundcard packet, offering great performance and an easy setup, allowing you to utilize your soundcard and computer as an advanced DSP packet modem/TNC.

FlexNet's sophisticated "artificial intelligence" gives you performance impossible for old-style systems to approach. If you've been looking for something new, something better for packet, It's already waiting for you.

Previously, there was no detailed information on setting up Flex32... That is no longer the case!

If you know someone who wants to get started with soundcard packet but doesn't know where to start, steer them toward this tutorial.

Just go to the web-site listed below, and click the banner to start learning about soundcard packet!

Charles Brabham, N5PVL
webmaster@uspacket.net
USPN: http://www.uspacket.net

USPN Donations policy: The best way to further USPN's purpose is to get out there and enjoy packet radio. So instead of sending us your money, take the cash and buy yourself a new TNC, or maybe help a new Ham get on the air.

Buy a rack of ribs, some beverages and throw a Packet Bash!

Those are just a few ideas, but we at USPN are confident that you will think of something to do with your money.

Charles, N5PVL

My MFJ1274 TNC was working on my PC386 but now it obeys CAL and K keyboard commands [DCD and PTT light] when connected to an eTower 500 MHz PC thru COM1 at 9600 baud.
Pushing spacebar will not change tone frequency and "D" won't cause two tones.

Tried several terminal emulation choices and flow control but does not help.

On the PC386 Procomm was the terminal program I used.
On the eTower PC I'm trying to use Hyperterm with WIN98SE.

Has anyone else been able to use Hyperterm with MFJ 1270 or 1274 TNCs?

If not Hyperterm, what terminal program works better? What terminal
emulation works?

Thank you for any hints.

Wow, talk about overkill for packet. :) Don't worry, I used my FT-100D for
packet
as well as voice. :)   I do have an FT-1500M as well and I use it for APRS.

Once again, I agree with everyone else, great rig. With 100+ memories, you
can store
every packet frequency known to the 2m band! :)

Try looking for XPWare. It's a very good, easy to use all mode TNC program.

Hackers from Brazil claiming to be Islamic Terrorists have hacked the USPN
web-site at http://www.uspacket.net

Sorry but the page will be down for a day or two while the server is
reconstructed. The USPN E-mail lists are working OK, but the web-site and
forum are temporarily kapoot.

The FBI has been notified, etc... Again, sorry about the inconvenience!

Ken,

Whatever you do don't call BuxComm !
He will make you feel like an idiot, and you should know better
before purchasing his "No Supported Soap Dish Interface".
What a piece of Garbage !

You want quality.. go with the SignaLink Interface.

Keith

I beg to differ, Ive had my buxcom rascal for 2 years now
and both times I had questions he was more than willing
to help me. I love my rascal, and highly recommend them.

Yes !
Purchase a SignaLink Interface..
No COM port is required.

Sent the "Soap Dish" back for credit..

Keith

Hi Folks ....

Ive just set myself up using the MFSK digi-mode. I am using MixW v.2.04 and i am receiving and transmitting text just fine, however what i wish to know is how to receive and send pictures using this mode as i see many stations sending pics. Do i need a Binhex program of some sort or what?? I have tried asking stations on air but unfortunately i have only spoken to foreign stations who dont seem to understand my question hi hi. It would be greatly appreciated if anyone can help me, many thanks in advance.

Dom (M0ASR / 2E0CIA).

For my part, I've had good luck with BuxComm, and the Rascal interfaces I have built and seen have all worked flawlessly. The times I have exchanged E-mail with Buck Rogers, he has been polite and informative.

I figure that "laborkei" is either making a dollar off the "brand X" interface he pushes, or it might just be that he's a garden-variety crank, out to run down BuxComm because "laborei" was too dumb to follow the Rascal's simple directions. A lot of times, guys like that will get frustrated and blame the manufacturer.

They will endlessly harass the manufacturer and when they get the old "heave-ho" that cranks deserve so well, they talk about how the manufacturer was rude and did not give "good service".

I used to have a girlfriend that complained a lot like that... She didn't react too well when she got the old "heave-ho" either.

Sour grapes!

I have both the RIGBlaster and the Rascal. Both work well and each have their own strengths and weaknesses. The Rascal went together with no problems and the price is sure right.

Dom,

You need MixW v2.07 to send pictures via MFSK. You can download the update from the MixW web site (www.mixw.net).

Hi Folks....

Many thanks to the various people who have emailed and answered this thread regarding my help on a matter with the MFSK mode.

I have now downloaded MixW 2.07 and succesfully receiving pictures.

Cheers,
Dom (M0ASR / 2E0CIA).

I am looking for a Y-adapter for a Yaesu FT-100D mic cable.

This is for being able to use a rigBlaster or the mic without always detatching the faceplate to connect and re-connect the cables, since Yaesu uses an RJ12 jack for the mic and RigBlaster's connections are RJ45.

Is there a place where I can purchase such an item?

73,
Dennis KB9VLP

I built a cable that employs the data jack on the back of the radio
and never disconnect the mic. An added bonus it works with the
817 and i suppose the 857/897s

Larry -

I seem to recall seeing that you won an auction on eBay for a PK232
from a fellow in Arizona on February 22.

Are you still looking for one? Did you take delivery of the other one?

Ron

This says how to set up AGWPE et al, but has zero
information on how it actually works.

The original poster actually asked:

> Can anyone point me to a site (or thread) that would help me
> understand how to decode packets received on my scanner, then
> connected to the mic input on my PC via the discriminator port on my
> scanner. I know it has been done before and have had some success by

> am lacking the knowledge to "decode" the data at a certain baud rate
> and making any sense of the bit stream.

If all you're doing is reading the samples, you've done
nothing, really. Sorry.

The underlying theory (sampled signals, FSK detection)
is well covered in any undergrad communications text-
book. One of my faves is Communication Systems by Haykin.
Try also Digital Modulation and Coding by Wilson. I've
never seen anything other than arm-waving on the subject
on the Internet.

This question comes up frequently and is a candidate for
a rec.radio.amateur.digital.misc FAQ, but since nobody
ever seems to read this group (or any other group, for
that matter) before asking, such a document would serve
no purpose.

There was a Visual Basic MDT-4800 decoder, with the lower
level code being C. This link:

http://www.geocities.com/SiliconValley/Lab/1067/MDT.HTM

Is all that is left, as the software is considered contraband. While
there is a few ZIP files there to show how to decode the bits, a
fully functional Windows program is only available via the

underground parts of society :-)

You do the same thing in software that you would do in hardware. That is, over-sample the data, synchronize the packets, error-correct, and then decode. If you start now, you should have something by Christmas... I would recommend not using Visual Basic, and stick with a simple user interface. I would recommend another operating system than Windows, but I don't want to trip-off any of the hand wavers out there.

Very interesting, but what does that have to do with anything but C-64?
Why the other items in the title when they are unrelated?

Thank,

hello everyone,

I want to work my IC-730 with my sound card along with the MixW program.
Anyone done this ?

Anyone works with IC-730 and digital modes ? (Rtty,Psk) Have you done this
with the sound card ? "URGENT" help needed....

Here's a hint to make it easier to get through the clicking.
use a real browser, one that lets you open a page in a new window. I
chose Mozilla.
When the image pops up in its own statusbarless window, reopen it in a
conventional window.
Now, you can see in the status bar what you are pointing to in the image.
It's a simple client-side usemap, so you can see which of the limited
number of possible destinations you're about to click... saves you the
blind searching.

Tx/Rx changeover time on the 730 is slow for digital modes like Pactor and
AMTOR.

Works ok with RTTY.

Regards

~All your base belong to us~

You might revisit the echolink website for application specific assistance.
You may want to set up a graphic equalizer audio filter to tailor the
soundcard audio to your ear. Quite often the net sending station is not
attenuating signals below 500 Hz and the resulting IM distortion is
difficult to filter.

I used to talk to people on Pactor when I had a IC730 and PK232.
I think it was the 720 that couldn't do pactor. I don't know if
it was marginal or not, but it seemed to work.

Hello All,

I have uploaded TrueTTY 2.01 to the main site and mirror:

http://www.dxsoft.com/truetty.zip
http://www.truetty.com/truetty.zip

Best regards,
Sergei

Windows HAM radio software at http://www.dxsoft.com

```
============================================================================
===
                     TrueTTY Versions History
```

V2.01
In MultiFSK mode mouse click at spectrogram defines lowest radio
frequency, not center one.
Documentation was update.
V2.0
The "Setup" menu was fully remade. Check "Setup->Interface" options now!
AFC was remade. It works properly at fast AFC speed now.
A problem with RX window scrolling was fixed.
Some minor bugs were fixed.
V1.98
DTMF-code decoding was made.
MultiFSK-16 receiving and transmitting were made.
Alt-D hotkey was made for "Clear Buffer" command.
V1.97
The documentation was update.
Some minor improvements were made.
V1.96
TrueTTY can decode signals from a WAVE-file now.
See the "File->Decode From File" command.
A WAVE-file must be Windows PCM file, without compression.
A sample rate must be 11025, 22050 or 44100 Hz.

Preferred file parameters are mono, 16 bit, 11025 Hz.

The ExchangeSpeed parameter of the TRUETTY.INI file defines data exchange speed via additional COM-port now.

Some minor improvements were made.

V1.95

TrueTTY can exchange receiving and transmitting data to another software via additional COM-port now. So, TrueTTY can emulate hardware modem or TNC. The "Setup->Data Exchange Interface" menu selects COM-port used for this purpose. So, with two com ports (in single computer or in two computers) connected via null-modem cable, you can use TrueTTY with another terminal software intended for hardware modem using. For example, you can try to use TrueTTY with WF1B contest software (though I prefer AALog). A speed of data exchange via COM-port is 9600 bauds. See null-modem cable schematics in NULL-MOD.GIF file.

If you are using COM-port for PTT interface but don't use it for FSK, you can use the same port for data exchange also.

Software COM-port emulator can be used also. I have used VSPD virtual COM-port driver from http://www.mks.zp.ua with success.

In AX25 mode TrueTTY can work (to receive and transmit) as KISS-TNC via COM-port or DXSOFTEX.DLL interface now. KISS mode is switched on by the "Setup->Data Exchange Interface->KISS Mode in AX25" menu item.

I have successfully tested TrueTTY with great AX25 software Pr4Win (see http://www.geocities.com/nl3asd/download/pr4win.html , http://www.qsl.net/oe8djk/) with hardware COM-ports (USB/COM converters) and with VSPD driver.

V1.93

The "File->Open KISS Capture File" command opens capture file to save all receiving AX-25 packets in the KISS-format.

The program behavior at not very vast computer was improved.

Some minor bugs were fixed.

Anyone know of any websites with Pocket PC software and ham radio ???
there is a nice one for Palm OS
http://www.qsl.net/va3pkh/palm-ham.html

but I want a PPC machine ...

Cheers
Tony.

Hello,

I am a newbie to packet radio. I would like ot know where i Could get hte software needed to use packet radio with my Alinco DR-135T. Currently I need to get the radio repaired, but as soon as I do, I would like to get into packet. Also, are there any links between packet, and the internet? Please let me know. Thank you

Peet Bros. weather station (Ultimeter 2000).

Great condition and guarenteed not to be DOA.

Includes display, accessory hub and HEATED anenometer.

http://www.peetbros.com/HTML_Pages/part1.htm#ultimeter2000

This unit retails for $379 and the heated upgrade is an additional $39.

Asking $320 O.B.O.

Please e-mail off list if interested.

Thank you,

John

Do a search for XPWare. It does most TNC's and is an all mode program (RTTY, packet, CW, etc.)

But you have to pay for this one and is more complex to use than XPWare which had a trial version.

Jacques VE3TSC

XPWare and Pkterm are both $80. Both have a full featured 30 day demo mode.

I am recording all phone calls, voice and fax, on my pc.

So I have a .wav file also for every fax received or transmitted with
the external stand-alone analogue fax machine.
There is a way to decode these .wav file into the original image?
As for weather faxes I think a 'softmodem' that analyze and decode wave
stream may be a solution.
But which software could do this?
Suggestions?

Regards.
lucky lu

My Tigertronics Baycom BP-2M tnc has developed a problem: no ability to generate the tones for transmission of the packet data (all receive and PTT functions of the radio work fine)

Anybody had this problem? Are these little units known for this defect? Anybody repaired one?

Will call Tigertronics but I have owned it for several years.....so...????

Hi,

A friend of mine and I decided to give packet a go yesterday, as we had two Kenwood TH-D7s available - packet ready handsets.

Problem: Most of the time, when we try to connect to each other, we get a message stating "[other party] is busy" - even when our link status (As shown by "DISP L") is disconnected. Then, for no apparent reason, upon the nth attempt at establishing a link, we are able to connect.

Resetting the TNC has no effect on this behavior.

Also, once we've connected and are in the converse mode, it was my understanding that we could write a message, send a packet, receive an answer etc. without leaving the converse mode. Not quite so. In order to read what the other party is transmitting back, I have to re-enter command mode, wait for him to finish his writing and then return to converse while he is going to command mode, in order to read my reply.

This procedure is so cumbersome that I suspect we're doing something wrong... :-)

The only TNC parameter changed from its default value is MYCALL, signal strength is excellent. (Distance between radios at present: 1m)

Google searches have given me a lot of hits telling me what I can do with packet, but not so many dealing with QSO procedures, debugging etc.

If anyone can offer some insight, it would be most appreciated. A dump of the TNC parameters is online at:

    www.stud.ntnu.no/~odderi/TNC.txt

Thanks,

Well, you have to realize that the TNC in the TH-D7 is crippled, and broken, to start out with. ;-) It is really only useful for APRS. It has numerous bugs, including total lockups when packets of particular lengths are received, a buffer long enough to hold only one frame, so that throughput is absolutely *terrible* on a BBS system, etc. You might wants to peruse some of the APRS SIG's at http://www.tapr.org for more gory details. ;-)

No big deal... Use your computer's soundcard for a TNC, and interface to the mike/speaker connections as usual.

Charles, N5PVL

Actually, it still is a big deal. Apparently Kenwood, in all its wisdom, chose not to use do usual pre-emphasis/de-emphasis that pretty much all the packet equipment running 1.2K through voice-grade equipment does, and you end up at about a 6dB disadvantage when trying to go through that route and communicate with other stations.

I own a TH-D7a, and while it's a nice, portable rig for APRS, it truly does suck rocks for general packet work. The real tragedy is that Kenwood came so close to making a nice portable packet machine.... *sigh*. The Alinco is really no better, as it used the same Tasco TNC chip that the Kenwood does.

What I'm looking for is all the data from the ARRL TravelPlus for Repeaters CD-ROM to load into Microsoft Access or SQL Server, to play around with some ideas I have.

I don't know if TravelPlus will let you export the entire database, or how big it might be. But if so then I wish someone would send it to me, don't forget to remove the NOSPAM from my email address.

My email inbox size limit is 2 MB. If it's bigger than this then we can transfer it via FTP server, yours or mine.

Thanks for your help.

Kantronics KAM
Old unit, has the GTOR upgrade.
Firmware perhaps version 6.2, not certain.
Cosmetically excellent.
Working when removed from service two months ago.
No manual.
Connectors included.
Asking $100.00 plus shipping.

Tasco uTNC21
Pocket size TNC2 clone, same as Heath HK-21.
Firmware version 1.6
Cable, manual and wall wart included.
Like new condition.
Working when removed from service two months ago.
Asking $50.00 plus shipping.

TAPR TNC1
"Gucci" case.
KISS firmware.
Many spare chips.
One of the very first sold by TAPR, circa late 1983.
Working the last time I plugged it in.
Original manual.
Asking $50,000.00 make me an offer over $25.00 :-)

===

Yes I could buy a copy, but I wouln't. I'm considering creating a
website that uses this data and will benefit all radio amateurs. It
would have online interactive mapping which showed all repeaters.

This will require over 100 hours of my time and more than $100 for web
hosting, which I am willing to give.

This is just an initial investigation. Otherwise I have no use for this
data.

If you reflect the attitude of most radio amateurs then I think I'll
just skip the whole idea. It's you loss, not mine.

Yes, please go ahead and skip the project. You do not have the character
nesessary for that kind of work, and those who do have their character
intact do not want software built on stolen or pirated data. Most hams are
persons with well developed personalities. I'm sorry to hear that you are
not.

In addition to not doing this project, I'm sure that most hams would
appreciate it if you would mail your ham ticket back to the FCC. We try to
maintain a certain level of decency going in the ham community, that you do
not measure up to.

For your own sake as much as anybody else's, its probably best that you
leave the hobby, never to return.

Goodbye!

Charles, N5PVL

Absolutely no loss either way - I am in VK and as such I am highly unlikely to make any use of it - and there is already a website here in VK that does that already for VK.
It is good that you are willing to spend time and your own finances to provide a resource, but what I was objecting to was your willingness to pirate software that is provided by an organisation that uses the profits to further amateur radio - if the software is not pirated that is. I am no angel and am not overly concerned with software piracy as most of the big companies are making obscene profits from badly overpriced products, but this one annoys me irrespective of your good intentions.
Maybe you should try contacting the ARRL and putting forward your proposal to them - you never know, they may well give you permission to go ahead and use a free copy of their product - or they could well tell you that someone else has already done what you seek to do.

Matt

I was a little surprised to see that. Your first post showed a call that came up Ohio, and I was going to suggest that the author was likely to be at Findlay, and quite possibly Dayton, so perhaps you could get together with him.

In any event, I would suggest you contact the author, N8DHF. I know he doesn't make anything significant off this, by the time you get the CD made, packaged, advertised, distributed, you're coming in pretty close to the selling price. He is a heck of a nice guy, and perhaps you two could get together to make something happen.

==

I don't see any great moral conflict here. I've bought a half dozen
repeater handbooks, now I just want it in computer form. I have no
interest in any software on this CD, just the data. How many times do I
have to buy the same data?

I'm really surprised at the responses here. They lead me to believe
that radio amateurs wouldn't give a dime to support a website that they
could really use. Nothing like what I have in mind exists today. It's
beginning to look like it would be a waste of my time.

Another thing which kinda sucks is that this data does not have the
exact longitude and latitude location of the repeaters, just the city,
which is a very imprecise metric. I had more precision in mind.

A repeater on the north side of Chicago might not work on the south
side.

This website could generate maps that showed locations of remote inputs
and main transmitters, but not if I can't get this information.

If you guys ever want to see a website that shows an accurate map of
repeater coverage then the ARRL needs to get know exactly where they are
located.

Write the ARRL and ask them to request the precise GPS location of all
the antennas. Knowing just the city doesn't cut it anymore.

I think you have me confused with the original poster (AF8F) - happily I am
still in VK.

> Write the ARRL and ask them to request the precise GPS location of all
> the antennas. Knowing just the city doesn't cut it anymore.

Many repeater and node SYSOPs do not want precise location data to be published, as a way of protecting tower sites from vandalism and theft. In many caes, the owner of the tower will frown on publishing location info for the same reasons, taking the decision out of the hands of any ham who wants space on that tower.

It may be that you can dig up this information; It may also be that you will lose many Hams their tower space if you are irresponsible enough to publish it on a web-site. Others will suffer from theft and vandalism brought on by your "concern for your fellow Ham".

If your project requires precise GPS location data for all US repeaters, this would be a great time to start looking around for another project.

Charles, N5PVL

==========================================================

Good point.

Consider this project scrapped.

Ask Bill Fisher, W4AN, how much money per year he looses running eHam and contesting.com. Those are two valueable websites, but hams (as well as the general public) think if it's on the internet, it should be free.

Also, the data on the CD is copywrite under a 'compliation copyright', that's why you have to pay for the data, but you only licence the data for your personal use, not for a website.

With hams as cheap as they are, I think it was a good idea not to do this project, while it was a good idea, you would have lost time and money, not to mention the abuse you would get from many hams.

Sigh...

New Logging Program?

I'm curious, what other logging program is there?

I originally bought LogWindows from AEA along with the digital mode program which could operate with it. It has been about 10 years for me, but support is now non-existent.

Unfortunately, it is unusable for me, as is.

I want to have packet cluster (TNC or Telnet), radio control (FT-1000mp), rotor control (DCU-1), and (optionally) some integration with RTTY/PSK-31 (PTC-II).

I've heard DXBase is good? Suggestions?

I think my laptop HEADPHONES-OUT is too puny to drive my radio thru the isolation transformers of a passive sound-card adapter like the

Rascal: Doing 2M FM packet, with Windows volume controls at 75%, I can
raise no nodes; with the controls maxed out, I can raise some but not
others. This laptop (Micron Millenia N5130) has very puny and
low-volume speakers and is barely OK on headphones at full volume.
The same equipment works FB when connected to my desktop with a real
sound card.

What is the typical power rating of the output jack of a sound card?
Is there a good way to measure audio power with a DVM?

If it is too puny, my intention is to get the $12 RS powered speaker
(# 277-1008) to boost the output. Any thoughts on this approach?

My old IBM 755C Thinkpad has a program to change the output level by specifying what sort of device is connected to the sound out. If I don't run this program, I can not drive PSK31 signals. I suggest looking for a program or setup option to change the output level.

Correct. Windows|Control Panel|Sounds|Audio lets you set your audio rig, with the most used being "Headphones" and "Desktop stereo speakers." I have the speakers selected.

I understand that TTL circuits use (about) +5 v for high and (about) 0v for low while modern PCs use (about) -9v for high and about 0v for low and that is the reason that interfaces using serial ports on the computer are incompatible with TTL circuits. But I have seen some circuits that interface TTL circuits and PCs using the latter's parallel port. Does the use of the parallel port somehow circumvent this incompatibility?

In article <xx2dnRP9zfnOvwWjXTWcqQ@comcast.com>, jsham5@comcast.net says...

> I understand that TTL circuits use (about) +5 v for high and (about) 0v
> for low while modern PCs use (about) -9v for high and about 0v for low and
> that is the reason that interfaces using serial ports on the computer are
> incompatible with TTL circuits. But I have seen some circuits that

Not quite. In fact, if an output pin on a PC's serial port only makes it to 0V on a swing from the mark condition to the space condition, the interface is out of spec and should be considered damaged.

The full specifications of the RS232 interface may be found here:

http://www.xs4all.nl/~lammert/comm/info/RS-232_specs.html

You are correct, though, when you say that TTL and serial port levels are not directly compatible with each other. That's why we have wonderful products like the MAX-232, and various other TTL/RS232 level-conversion chips.

> interface TTL circuits and PCs using the latter's parallel port. Does the
> use of the parallel port somehow circumvent this incompatibility?

Yes and no. The parallel port does indeed operate on TTL levels. However, as its name implies, it transfers data in parallel format as opposed to serial. If you want to feed serial data to a parallel port, or vice-versa, you need a serial/parallel converter.

Your question leads me to suspect that you need a little more data.

A serial signal consists of 8 bits of data, sent to (or received by) the computer one after the other. The 8 bits are preceded by a start bit (or two, depending on your port settings) which must be low, and followed by one or more stop bits, which must be high. Thus, 8 bits of data require 10 (or 11) bits be sent. The timing of the bits it important, and this is the "baud rate" that is in the port settings. Thus, a baud rate of 9600 baud means that each bit is 1/9600th of a second. There is no time allowed between bits, but you can spend all the time in the world between bytes. The transmit and receive pins are separate, and depending on the software, data can be sent and received at the same time.

Associated with the serial port are a number of control lines as well. Although they don't do anything to the hardware, they can be sensed by the software, and depending on the software, they can tell you if there is a program ready to accept data, and you can tell the program that you are ready to listen. Depending on the software, you may find the link does nothing until you get these control lines right. There are also some lines that have to do with the status of the telephone line that might be attached to the modem that might be plugged in. Although it is less common in recent days, sometimes the sequencing of lines has to be right before the software will respond. For example, it used to be quite common to insist on a sequence like 1) Phone rings, 2) computer orders phone off hook, 3) carrier is detected, 4) Device is ready to receive.

As was mentioned, RS232 is actually plus and minus 15, although most RS232 ports will respond to almost anything that crosses zero, and some will treat something sufficiently close to zero as if it were low, but this is hardly common.

A parallel port transmits 8 bits of data at the same time over 8 signal lines. In addition, there are lines to tell the device that the 8 data lines are ready to be read, and a line that allows the device to tell the computer that it's ready for data (sometimes called the strobe). The computer will keep the data available line active for a fairly short time, around a microsecond.

If you are simply trying to bring a simple signal into the computer, there are 2 things to consider. First, without some logic on your part (for example, a microprocessor), you are not going to be able to use existing PC software. Secondly, if you want to avoid logic in your circuit, you will probably use one of the control lines, rather than a data line, and you will need to write your own PC software to read it.

Hope this helps.

..

Does anyone know what kind of gaming via packet radio was available in the early '90s?

Michael

I'd written a kind of minesweeper for PC-DOS, so it could be used by
GP[1]. And there have been some other similar games around.

Gruss,
  Walter

I believe there were several games made for FBB BBS. A good place to look for old stuff like that would be ftp.funet.fi in ham/packet/bbs/fbb - Something like that, anyway.

Might be worth a try!

In article <V36ma.434854$3D1.234635@sccrnsc01>, michael
<mikagan1@attbi.com> writes

>Does anyone know what kind of gaming via packet radio was available in the
>early '90s?

I wrote a "noughts and crosses" (you may call it something different on your side of the pond) game for my BPQ node, that was very popular with

local packet users in the early '90s. It had random "human frailty",
which allowed them to win occasionally!

I also remember that someone wrote a packet draughts (checkers?) game,
but I can't remember any details.

Not games, but two other apps I had on my BPQ node were -

1. Off-air deviation measurement.

2. Decoding of RTTY SYNOP transmissions, that made available weather
   reports from all the SYNOP reporting stations in the UK.

Packet was quite interesting in those days...

hello everyone...

Looking to find frequencies for HF Gateways to some bbs's over Europe on 10m. My sysop is thinking to change the operating freq. 29.250FM 1k2 to somewhere else...Please reply if you have any info about where we can find bbs's that have HF gates on 10m, or where we can go to send/recieve forward from other bbs's.

73's de SV2EVS

P.S Dont reply here, rather use my e-mail: sv2evs@qsl.net

I've just ordered a "Rascal Mark V" and cable; looking
forward to giving PSK31 a try.

I'll be using an 1800mHz PC with Windows 2000.

Any recommendations on preferred PSK31 software? TIA!

I am talking to an official of the local Mountain Rescue group about APRS. Their interest relates to search teams, particularly in knowing exactly which area was covered by each team. Imagine a multi-day search, with several groups going out each day. Hard to keep track of which areas have been searched, and what has been missed, at the incident management level. Also, if you had real time data, you could redirect a group that was going over an already searched area. Put a laptop in the command vehicle, and little GPS/TNC/Radio packages in the pack of the leader of each search party.

Obviously a road map is of no value, topographic maps are required. This group primarily covers a single county, so we are not talking about a huge area for which topo maps are required.

I use APRSdos, but have not used any of the newer APRS software. Someone I know recommended UI-View for this application.

I have not seen much info on the web releated to APRS and Search and Rescue, mostly articles that seem to be talking from a "You could do this" standpoint, rather than "We have tested this extensively and this is how we do it". In other words, it looks like some theory but no practice.

Any comments or suggestions?

APRS would seem to be a solution, but it is a monolith of features. Like everything having to do with packet, the kitchen sink must be installed in every software idea.

I wouldn't depend much on a topo-map, as they are probably 20 years old, or more.

Rather than tracking searchers, which is probably a lot of useless information, I would have the team leaders transmit a grid number and start and/or end time, plus any other useful info.

Then I would shade the areas of an electronic map as they are covered. You might look into the new tablet computers, and map and overlay solutions.

For example, you can scan a map in, overlay it with a grid, and then write
notations on it using Paint Shop Pro for example.

The Team leads can use GPS to locate their grid borders.

Such is the nature of most software - 90% of users don't use 90% of
features, but they don't all use the same 10%... Unless you are paying
for bespoke applications to be written for you, you're always going to
have features in programs that you don't use. Good software makes it
easy to ignore the features you don't want to use.

>I wouldn't depend much on a topo-map, as they are probably 20 years
>old, or more.

I guess that depends on how much the topography has changed over the 'n' years since the topo maps, such as those available on Terraserver, were made. If we're talking about areas where road maps are of "no value", then the changes may well not be very great.

>Rather than tracking searchers, which is probably a lot of useless information,
>I would have the team leaders transmit a grid number and start and/or end
>time, plus any other useful info.
>
>Then I would shade the areas of an electronic map as they are covered.

That can easily be done in APRS by plotting history tracks. Also, if someone has a suitable electronic map for doing what you describe, then there is a good chance it can be used with APRS. The great advantage of doing it using APRS is that the team leader can leave his radio to do its own thing - transmitting a position beacon at regular intervals. He doesn't need to input grid numbers, etc. If he wants to occasionally transmit "other useful info", then he can send an APRS message. Also, his radio will be forming part of a digi network to improve the reliability of communications between other search teams and base.

I would suggest having a good look at the wheel that already exists, before you decide to reinvent it...

Hello,

I am trying to connect to an APRS Server via internet but it does not work.
It displays "TCP OPEN FAILED" in red colour on the bottom of the screen.
It happens with any server. I have already put the TGP Extension in the extensions folder.

I am using iBook System 9 and G3 Blue System 9.2

Any idea about it ?

Waiting for help, better by direct email:

Try doing a telnet to the server using a port number. If that doesn't work, then your protocol stack is broken. If it does work, then your APRS software is broken. Try another version.

I don't think this is so much "reinventing a wheel" as using the correct tool for the job. There is such a thing as too much technology for the application. What I was suggesting was a simple tool that already exists as well, and nothing needs to be reinvented.

While it would be neat to have some simple trackers attached to, say, a backpack or truck, spewing out raw information every couple of minutes, it might also be useful to have processed information from the source. Most searchers will know where the grids are, and the team can consist of large numbers of people. Unless you are planning to put a tracker on every searcher, all you will see is the leader moving around (maybe at the edges of the grid).

This is also a non-amateur application, and most APRS software has restrictions against this, so you will have to buy the commercial version (if it even exists).

Obviously that is something only the individual authors can comment on.
I certainly wouldn't define mountain rescue as a "commercial" activity.

Anyway, if KA0DXM is still reading this thread, and would like to email
me direct, I've made two sample topo maps of an area near his location,
so he can get an idea of the sort of quality of topo map that could be
used with UI-View.

Is there any DSP freeware that works for voice?

I found FFTDSP for $32 and SkySweeper for $95.

>

Your radio dial shows 144,199.300, but your actual RF going out is 700 Hz
higher, on 144,200.000.

How someone listens to it depends on which mode they have chosen: CW or
SSB. If CW, just set the receiver to 144,200.000 and the receiver's BFO
will automatically be offset to produce a tone. Using SSB, set the
receiver to 144,199.300 (if upper side band) and you will get a 700 Hz
tone.

I recommend listening to CW using the CW mode instead of SSB because your
radio's dial will indicate the actual transmitted frequency. When using
SSB you have to mentally add or subtract the frequency of the audio tone
to calculate the original transmitted frequency.

The above is correct IF both transmitter and receiver are set to the same dial frequency and same sideband (upper or lower). The complication comes when the transmitter is in sideband mode (emulating CW) and the receiver is in actual CW mode. See my previous post for additional info.

Once I got a piece of thin tissue paper, put it together with a comb, and
was able to do a pretty good wondition of "turkey in the straw"...

Practicing with the same paper/comb rig as a child, I found that I was
finally able to imitate those distorted voices I used to hear on my father's
shortwave reciever. Having this ability under my belt, I knew I was at last
ready to become a ham radio operator. I had been able to decypher the
garbled voices on shortwave for years, but now I could produce them as well!

Is a computer needed with a KAM Plus unit or just dumb
terminal.
Very new to this of course.
With a KAM, can you not have to use a sound card at all.

How does one normally tune in, for example, a PACTOR
signal?

----

1. Yes, a computer is needed to "talk" to the KAM. The KAM must receive directions on what mode to use, whether to TX or RX, and so on. It has a lot of brains, but not that much.

2. No sound card needed with a KAM.

3. Pactor uses the same shift as ordinary RTTY and tunes the same way.

BTW, since you're new with the KAM, be aware that it has two modes: Terminal and Host. Host mode is the more capable by far, but Terminal works fine within it's limitations. You don't need any special software for Terminal mode; Window's built-in HyperTerm program will do. You do have to purchase software to run in Host mode, but I think you'll find it FAR more convenient and I highly recommend it. And one other thing. If you use Host software and have it set to leave the KAM in Host mode after shutdown, you will not be able to access the KAM using only Terminal mode software the next time. If you don't know this little fact, it can drive you nuts.

Don't ask me how I know. :-)

One Small Nit, You could use a dumb Terminal if it uses RS232. You can use the Control keys to control it, a bit combersome but doable. I used one on a KAM long long ago (Bought mine in 1985).   You said so when you said TERMINAL Mode :).

> have to purchase software to run in Host mode, but I think you'll find

I recommend XPWIN. Great program.

Yep a computer is needed. Software can be most any softwear for
the system you are using long as it is a Terminal program such
as VT102 emulators, Procomm, pakratt, kams own software etc.

I think you're right. I was thinking of using a computer to emulate a
dumb terminal, therefore thinking you needed an actual computer.
These Senior Moments are coming more and more often lately. :-)
Sorry 'bout dat.

In other words, a computer is NOT needed. Instead of a computer
running a Terminal program to emulate a VT102 you could just use
a VT102 (or just about any other dumb terminal).

They tend to sink, but do not have enough mass for a good boat anchor,
even if you can get the EPA waiver. ;-)

Seriously, if you can find them VT320s and VT420s are not that expensive.

A used 486 laptop with a terminal emulator works fine, and in many cases
can be found for about $30.00.

Kermit is an excelent terminal emulator and is also low cost.

Yes, but you were stupid enough to reply to my message.  You're the moron. You
post messages in here and get few responses, maybe you'd get a clue that no one
cares what you think.

If a real emergeny occured, I wonder how fast the professions would tell you to
get out of the way and go home, since that's what we do with know-it-all hams
like you.  Ham radio is a hobby, and when all hell breaks loose, you'll be told
to go home, like so many other wannabees.

Copper was created when two hams fought over a penny. Were you one of those
hams?

In addition to the USPN Forum, there is now a selection of E-mail lists for discussion and support.
Categories include:

Packet   - General discussion

Net - Packet Networking discussion / support

BBS - Packet BBS SYSOP list

FlexNet - Discussion / Support for the FlexNet networking package

RadioMirror - Multicast discussion / support

Subscription is web-based. Go to the USPN web site   http://www.uspacket.net and push the "Lists" button for more information.

There will be more list categories as the need arises.

Hello All,

I just have uploaded TrueTTY 1.98i beta to the main site and mirror:

http://www.dxsoft.com/truettyb.zip
http://www.hamport.com/truettyb.zip

TrueTTY can receive and transmit MultiFSK-16 now.

I am fairly new to PSK and would like to see if anyone can help. Basically, I am looking to setup a PSK packet network through a series of repeaters. I would like to have APRS, SSTV and a BBS setup as an Internet Gateway.

Can anyone shed some light on this? I would be very appreciative.

```

I've been pretty much off the air for a number of years and it appears that a lot has changed in the digital world since I left.

I'm currently just trying to get back into VHF packet as a first step, and I've become a little confused when I look at what is happening in the Linux world. I have an Heathkit PK-232MBX that I used to use for digital work, and it appears that VHF 1200 baud is still popular so I could use it, but I haven't found a host mode terminal program for it.

It appears that I could also use something like linpac, but I'm not sure. As I was going through all the ax.25 stuff, it appears that I would be configuring a node, which is more than I wish to do just now.

So, should I keep looking for a host mode terminal program for the PK-232 or configure the soundcard/ax.25 stuff and use something like linpac relagating the old PK-232 to the bin?

PSK 31 is intended as a human typing speed mode.

While you can transfer files with it, they go very slowly. You may want to investigate Pactor, or Packet both of which have been used for gateways.

Back when HF packet was popular, 300 baud (or 1200 on ten meters) was used to get into bulletin boards. Working through a repeater cuts the data rate to 30 % or less of the direct data rate.   These modes were painfully slow with text files. Since PSK 31 runs only about 31 bits per second You may get faster response, by printing out the results and using surface mail. (:^)

You can use your PK-232 just like the soundmodem as long as it has KISS mode. Then it will appear as a normal Linux AX.25 device. Use the mkiss kernel driver and kisattach to set it up.

I don't know if linpac uses the standard AX.25 devices or not. I guess not. It would probably work with your PK-232 without the above kernel setup, then.

Look in the manual for the IC756PRO. If memory serves me right, one normally uses the ACC2 connector to connect the PRO to a multimode TNC or soundcard. If you can't find what you need in the manual, send an EMAIL to your dealer or directly to ICOM.

Hi Mike

You may want to try the JNOS mailing list. The folks there should be able to help you. (I don't have a link but you should be able to find it using Google)

Have you tried to manually put the PK900 into KISS mode using HyperTerminal and then try JNOS?

Rob

Automatic Link Establishment. It works with 2 or more transceivers to maintain reliable communications with the other stations by picking the best frequency between the staions. I know that Harris radios will allow the ALE mode, but have not heard of a software version of this, just hardware version. The ALE is done automatically with the radios and the operator just sits back and works the radio as the radio will pick the best frequency. Military uses it quite abit.

A good, short and to the point explanation, Mike. Those wanting more,
go to the "http://www.google.com" search engine, click on "Advanced
Search" and in "with all of the words" enter: "ale radio" (no quotes).
Numerous hits.

Thread:

The way to think about ALE or automatic link establishment is that it is a

computer
automated method of replacing the skilled HF operator/propagation analyst.

Utilizing measurements derived from received signals, the ALE computer
algorithms
automatically control the frequency selection and assignment and end-to-end
link
establishment between end HF stations in an HF network. The military and
others
were/are interested in this computerized HF link establishment automation so
that
ordinary soldiers/sailors/airmen can operate HF radio systems without the
expert
help of trained "signalmen".

As such, one one level, it would take a lot of the "human" fun out of ham
radio.
On the other hand, ALE algorithms and their perfection does present certain
interesting challenges to those who would seek to improve ALE techniques.

For a professional outlook on the technology and further information on ALE
see for instance:

http://www.hfindustry.com/ale.html

and

http://www.hfindustry.com/Default.htm

Best,
--

Hello all. I'm extremely proud to announce the opening of a brand new SXList.com contest! This contest is amazing, there are tons of prizes, and entering isn't that difficult. There are three main categories, and one basically just involves adapting code to the Scenix chip. If you've had an idea for a microcontroller based project, why not check out the Scenix chip? You could win great prizes!

The contest is focused on the Scenix microcontroller (a PIC compatible unit that offers up to 75MIPS). Have an application that needs blazing speed? The Scenix chip is easy to get into and offers tons of speed. By just coming up with an idea, you may win all the development tools you need to put it into action!

If you wish to pass this information on to others, please feel free. The contest is an excellent opportunity for beginners and experts alike. And everyone benefits by the addition of SX examples to the web library.

For complete contest details go to http://www.sxlist.com and follow the Design Challenge Contest link. At the end of this post will be the official release.

Enter soon, and enter multiple times! We look forward to your submissions!

Thanks!

Josh
--
A common mistake that people make when trying to design something completely foolproof is to underestimate the ingenuity of complete fools.
        -Douglas Adams

SXList.com 3 WAY WINNER CONTEST

There is a new contest at sxlist.com! And this one has 3 ways to win! Are you a HARDWARE wire head? A SOFTWARE guru? or are you the IDEA person? Anything is ok! You can just send us a good idea, or share a circuit or (learn?) PCB design, or show us some cool code.

Prizes will include SX-Keys, SX chips, SXWiz BASIC to ASM code generator, Ethernet demo boards, RS232 level converters, and your name in lights on SXList.com!

In the past, I've set the focus on nearly finished projects (code ready to debug, design finished, etc...) and we have received some really nice entries...

http://home.attbi.com/~andrew.g.miller/sx-x10/ The SX-X10 Internet Home Automation Remote Control.
http://www.sxlist.com/lib/io/dev/video/servid.htm The SERVID 4x20 bit banged video terminal.
http://www.sxlist.com/contest/reverb Digital audio reverb and echo effects   box.
http://www.sxlist.com/contest/sxohm SX PBX On-hold messaging switch
http://www.sxlist.com/bindicator Bindicator remote display
http://www.sxlist.com/contest/aquamon SX Aquarium Monitor (in SXWiz BASIC)

I'd like to move the focus to a slightly less demanding contest and offer several different points of entry:

A) Ideas that match the SX chips well: What application can you think of for which the SX chips are a perfect fit? Something that could be done in a PIC except for the lower clock speed. Something that needs THROUGHPUT (or that involves doing a bunch of slower tasks all at the same time so that one SX could replace several PICs) but doesn't need a lot of RAM or a huge amount of code. An application where the power supply can support the high speed requirements. Here are some examples: http://www.sxlist.com/idea/sx.htm

B) Great Circuits or Printed Circuit Board Design. Have a really killer little circuit that involves an SX? Then you have an entry! But I want to encourage another path here as well: Right now, AutoTraxEDA is GIVEING AWAY the current (first) release of their professional PCB design software: It supports Mult-sheet schematic entry, circuit simulation, rule driven PCB layout, fast autorouting, 3D visualization and Computer Aided Manufacturing tools. WOW! They will be charging for it at some future date, but for now this is a fantastic deal for the little guys. http://www.autotraxeda.com/Purchase/purchase.html

Co-incidentally, a PCB manufacturer is giving away PCB panels in return for posting a public design using a compatible processor. SX is ok. See: http://www.sxlist.com/piclist/pcbcontest These are limited to double side, 160x100 mm, solder mask, component print and must follow the guidelines posted at http://www.olimex.com/pcb/techinfo.html but you get an entire panel free and the quality is great! So... Design a PCB using an SX, if you haven't done one before, this is a great opportunity to learn and you can get a fantastic design program FREE. If you win, I'll throw in one or more of the prizes above in addition to your PCBs.

C) Code snippets: Any bit of code that does something better, faster, or that hasn't been published already on the SXList.com site. If you can't publish the entire project, but you have one part that you are especially proud of, share it (and let the world know who you are). Lots of people have published something on sxlist.com and been amazed at the number of questions, thank you's and even, sometimes, yes, actual paying jobs! Come on! You've figured out something that you're jazzed about! Show us what you got! Just starting? No problem: Browse the PICList code library http://www.piclist.com/lib or PICList archive and find some code that you would like to see in an SX. Use the MPASM to SASM code converter: http://www.sxlist.com/cgi-bin/mpasm2sasm2.exe and then check for any warnings and clean up the code for the SX.

The prizes are nice, entering is easy... I expect to be overwhelmed with entries! Use the little form at the bottom of the webpage to describe your entry and/or send the files to JamesNewton@sxlist.com

Hello Everyone,

I made a selection for amateur software.

MMTTY 1.64
AGWE 2002.10
UIVIEW 2.39
WINPSK 212
WINPACK 6.8
MSCAN

Links to all amateur factories, and antenna's

DX cluster from HF to SHF!

many more!!!!!!!!!!!!!!!!!!

Just look at:

http://www.qsl.net/pd0rkc

73's   Cor

Hank get out of the house and stop having sexual intercourse with your cats.
I hear nina died of a swollen anus, hmmm
LEAVE the CATS ALONE.

for more info on Hanks sexual attraction to cats, visit his web site
http://horedson.home.att.net

Yes, Maine Coon, from a farm on the border between MA and NH,
picked up when we lived out there. Her replacement is also a Maine Coon,
rescued from a roadside not far from here. Excellent mousers, gentle cats.

Maiko Langelaar VE4KLM recently announced a new digi feature in Flex32, on the FlexNet support list at QSL.net.

Here's what he had to say:

Greetings to all,

Another goodie discovered by accident. I sure haven't seen it documented anywhere lately (if it is, would some kind soul please let me know WHERE).

Did you know that FlexNet32 has a built in Mini Digipeater !!!

Yes, it does. Instructions below (thanks to Sassan for providing this very usefull information to me). My interest has been re-energized because of it :

> just set your callsign (without SSID!) on Port 15, and start your
> connects from the NOS box always "via yourcall-port". Flexnet32
> uses the SSID after the digi callsign to route the packet to this
> flexnet port number. Example: To connect from any port via port 3,
> connect via yourcall-3.

"set your callsign" using FlexNet Channel Parameters, click on
the Channel '15 LOOP', and magically a MINI DIGI window will
appear where you can add your digipeater callsign.

Also, that NEWQPSK mode sounds sooooo cool !!! I'm going to see
if we can get a few local people to start playing with as an
alternative to the *old* 1200 baud AFSK. I'm curious if we
can indeed get 5000 baud.

Anyone have any comments or suggestions regarding the use
of 5000 baud NEWQPSK on the 2 meter band ?

Best regards,

Maiko Langelaar / VE4KLM

I downloaded it and tried the new Flex32 myself... Looks pretty good!

Charles, N5PVL

You can use any dumb terminal program.

One that is very good for ham TNC's and multimode controllers is the terminal program included in Logger. Do a search for "Logger" and "Zakanaka" on google. You should find download links for Logger (and for the PSK31/RTTY program for a sound card called Zakanaka).

Both Logger and Zakanaka are free!! Just use the commands in the MFJ1278 manual to operate AMTOR etc. I have used Logger with many different multimode controllers such as the KAM and PK900. It works great! It should also work great for the MFJ.   No need to spend lots of $$$ for a terminal program!

You may want to see if there are any MFJ groups at Yahoo groups and ask there. You can also ask for any programs on the digitalradio group at http://groups.yahoo.com.

Logger works good for the MFJ-1278 and there is also a MACRO available for
Logger for use with the 1278. It makes things much simpler to setup. I've
only used logger to receive since I no longer have a license.

The original article was in the September 1984 Maplins Electronics
Mag.

Send me an e-mail if you can't get a copy locally and I will copy the
article and post to you (scanner is not available at the moment).

First, a little free advice.

Posting the same message multiple times to the same newsgroup is actually more likely to get you ignored than anything else.

Also, the days when computers only recognized upper case are long gone. These days, typing a message in ALL CAPS is considered rude (shouting). Use a normal mixture of upper/lower case, just as if you were typing a letter, and you'll get along fine.

With that said: You have my deepest sympathies for being stuck with Windows X(tra)P(ain). A Google search using the phrase 'Amateur Radio Logging Program Windows XP' (without the quotes) turns up over 700 hits. I'm sure you can find something in that stack that will fit your needs.

Good hunting.

Interesting. You make the assumption that, just because I dislike

M$ products and M$ in general, I must be referring to Linux.

Got some news for you: I don't like Linux either. Too far away from the stable, tried-and-true Unix-type OS tree for my comfort.

No, I have a number of reasons for harboring an intense dislike of Billy-boy, the Redmond Empire, and their related products, none of which have the slightest connection with Linux. If you want to know more, you can E-mail me. This is not the proper forum for an OS debate.

Suffice to say that, while M$ stuff may be OK for desktop systems, I would never trust ANY of their products (certainly not XP!) to run critical systems, such as my Internet servers. For that, I rely on NetBSD, Apache, Postfix, and other open-source stuff.

> And he wasn't looking for a list. He wanted advice from real people.

Hmmm! Now you're implying that I'm not real? If that's the case, then this is one heck of a substantial hallucination I'm living in! ;-)

If you have some advice to give, then I invite you to post it. I provided what I thought was good advice, in the form of presenting the seeker with what amounts to a large number of choices for logging software.

Personally, I think freedom of choice is one of the most important cornerstones of our society. I'm sorry if you disagree.

Hello,
I just put on the web, my last program for EVM56002 board :
http://thierry.leconte.chez.tiscali.fr/radiodsp01.zip

radiodsp is a program for the EVM56002 motorala evaluation board
that implements classical DSP audio filters to improve ham radio reception.

Its features :
- an AGC
- a band pass filter with 4 selectable bandwidths (100Hz, 200Hz , 1500Hz and 1800Hz)
- a auto notcher
- a denoiser

For more information see :
http://thierry.leconte.chez.tiscali.fr/radiodsp.html

try and enjoy
F4DWV

Here is some advice (free too!): tell us which logging program you use,
and why you like it. Don't forget to mention how it works in Win XP.
If you can't do that, then you are just another silly spammer.

I have had good luck with N1MM's "Logger". Nice integration with

the radio (Kenwood TS-850). Excellent integration with DX Cluster.
This is mainly a DX contest type logging program, but I use it for general DXing.
Have run it in Win 98SE and Win XP.

Have played around with at least a half dozen others, but not to the extent that I'm willing to give advice about them. There are many many logging programs out there. You might Google for "Amateur Radio Logging Software" or some such ...

There do not appear to be any useful logging programs for any form of Unix, so have no idea what the spammer is whining about.

Looking back over my original post(s), I find you're absolutely right.

<sigh> That's what I get for trying to make sense after five straight hours of building a replacement mail server.

My apologies to Vince and Bill both. There was absolutely no call to respond as I did about XP, no matter how I may feel about it, and I probably could have been more helpful in regards to logging software. I should know better, especially considering that I run a side business.

Ok... No more midnight-plus postings for me!

Hello everyone,

I am thinking of getting a used PK-232 so that i can work packet/rtty/sstv/psk and everything else with my HF...What is the suggested price for a USED tnc like that ? Is 150 Euros ok ?

73's de SV2EVS

P.S Anyone knows a site with used tnc's ?

E-Bay seems to be selling used TNCs in the $75-125 range. There are
typically 5-10 TNCs
including the PK232s on any day.

Depends on age, firmware, condition.
I sold mine for US $15.
Very old, very old firmware, dented and scratched :-)

The standard PK-232 will not do sstv or psk31. May or may not do
"everything else".

You may wish to look for a PK900, the PK232's successor. There's
one up right now at:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=3008916432&category=296

Perhaps you are joking?

"KLog is a Ham radio loggin program for KDE.
This is my very first KDE program so it has many bugs, please help to correct
them. :-)"

"Xlog is an easy to use program
for logging your radio contacts. Contacts
are saved in a browsable list which can be edited."

Just a few missing capabilities:

Integration with DX cluster

Band maps

Needed entities per band/mode

Dynamic scoring

Callsign -> Prefix -> Entity/Zone database

Contest definition database

Run vs. H & P mode
  Run rate
  Auto serial increment
  Markers for H & P

Control of multiple radios
  Click to tune from band map or DX cluster spot
  Auto CQ

ODBC connectivity for analysis programs

Export in ADIF, Cabrillo and CSV

Summary reports: entities per band/mode, zones per band/mode, etc.

I see. I still lean toward pen and paper for logging, and don't miss the missing features.   I guess I don't expect a logging program to act as integrated station management software.   For me a simple program such as Xlog is OK.   A good text editor (not a word processor) is even better.

Thanks for your answer.

It's an old story. Talk about a good program that runs under DOS, "Winders", or even the Mac and a Linux enthusiast will be there with that question, "Have you tried "XYZ" in Linux?"

You could be talking about MS Word for Windows, and they'll suggest a Linux text editor that looks like it came straight out of an old ATARI system, ugly, buggy, barely functional. Then you hear the plaint; "Don't you think "XYZ" is useful?"

Linux enthusiasts may not be aware of it but yes, many times they are joking.

Sorry, Linux enthusiasts, but "barely functional" under Linux does not really compare with "works great" under other platforms.

I've heard that there is some really great software for Linux... Why not talk about that?

You are welcome.

I also keep an archival log using Access so I can generate
reports, do queries, etc.

A simple text file based log is fine until you have many
thousands of QSOs in it, and want to ask questions like
"How many states have I worked on 10M SSB and who
```

was my first contact in each state and do I have their QSL" :-)

Hi. I'm interested in any information you may have on the clover mode. I'm interested in it as it is apparently a highly efficient and capable mode.
Thank you.

Just starting out with SWL. A question comes to mind immediately: With the proliferation of always-on internet access, PC signal analysis, PSK and packet radio, is there already a software package out there that analyzes signals, looks for a specific signal signature (including source call-sign & possibly their current IP address), and immediately sends a signal analysis to the sender via the internet? Example:

Sender A wants to see how his signal is across the globe. He tunes to a specific 'test' frequency. Pulls up this piece of software and hits 'test'. The software sends the signal in say PSK format including his call-sign and IP address. All the other users of the software would leave their radios tuned to the 'test' frequency when not in use, with the software running. When the software detects the signal it grabs the

IP address and performs a signal strength analysis. It immediately sends a report back to the sender via the internet. Where the sender's software receives these reports (via the internet) and shows the operator his signal strengths from all the other stations. You could even go as far as to include the receivers Lat/Long and display the reception reports (with signal strengths) on a global map.

Excuse my ignorance if any of this is impossible or already done. I just thought it would be a very interesting piece of software.

Sounds fairly interesting, and not all that difficult to do.

Perhaps a better way to handle the signal reports would be
to post them to a single database server so they could be
seen by everyone. That sever could also analyze all reports
and produce a propagation map.

Each station could also port reception reports for signals from
stations in the existing beacon network ...

Hi,
At this moment I'm creating macro files for the PTCIIe and the mixw program.
You can now download the RTTY and PSK31 macro file. I'm working on a RTTY
contest macro and a pactor macro.

Hi,

Any terminal program can run a device like the PK 88. Have you tried the program called Hyperterminal? It's already on your system, most likely.

An addendum to my post:

If you're planning to use your PK 88 for amateur TCP/IP work, you'll need one of the "NOS" programs. Not sure what, specifically, to suggest, but a look with your favorite search engine should turn up many of these. They've been around since the days of MSDOS.

Good Luck,

Dave wx1g <dave.hunt2@verizon.net>

Regards to everyone,

I've just installed TNOS 2.4 under Linux slackware 8.1. When I log
into the bbs and send a message, the message gets delivered and
everything looks ok; but when I log off from the bbs Tnos exits. When
I restart the program and look up at the log.net file, the following
warning appears as the last logged action:

A crashprotect prevantable restart ocurred from a SIGSEGV signal.

This only happens on delivery (even local delivery), because TNOS
receives mail ok from elswere, and the rest of the bbs commands seems
ok.

Any input welcomed

Announcing the PSKfest 2003 Certificate winners. For this year's event the 070 Club is awarding certificates to the top three scores in each category/continent. See < http://hometown.aol.com/n3dqu/2003_pskfest_results.htm > for the final results.

This year we had 121 entries in the PSKfest, a very nice turnout. Special recognition to 070 Club member N8PSK for TOP DOG score of 25,434 points, fb job Chris! Also special mention to SWL member F-16527 who logged 378 QSO's in the contest!
Congratulations to the certificate winners and many thanks to all who played in the PSKFest, especially them crazy QRPer's :o) A well deserved attaboy also to Contest Manager Steve N6YIH/7 for taking care of all the logs and scoring (Tnx om, couldn't have done it without ya!). Will be looking for you all in the next one....73 de Jay N3DQU.

That's the advanced stuff... You have to get past the "sound of one hand clapping" part first! No line-breakers!

Seriously though, it does sound like a good idea. I hope somebody runs with it.

They are all in the 28.20-28.30 MHz range. The rest of the "restricted" part of the band (28.00-28.20) is for CW.

I didn't notice anybody being offended. On the other hand, this is a newsgroup dedicated to digital amateur radio, there are other newsgroups that do cover CB topics, not to mention the numerous european web sites associated with digital CB, where you can get more specific information.

I'm surprised that they require CWID for CB packet, but then again, CB in

the US and CB in europe are two different things for sure. I think the
europeans have a much better deal.

Does it ever cross your mind that recruitment to amateur radio might
well come from CB'ers? Probably not...

I don't remember the gentleman expressing any interest in switching hobbies.
```

I suppose your theory is that newsgroups dedicated to Ham Radio should also include CB, family radio, and commercial radio topics. Hey, let's not forget government radio, such as the police and firemen use. Some of those become Hams, too! And then there's the Radio Control enthusiasts, they use radio... And people who own cordless telephones and who own garage door openers, it would be unfair to leave them out. An even larger group uses microwave ovens. You'd be surprised how many Hams today owned and operated microwave ovens prior to becoming Amateur Radio operators.

Sheesh! Some of you guys are worse than old ladies. Try to get with the program, Roger. We have so many newsgroups because they are intended to cover the subject matter implied by the name.

You have to buy the upgrade or re-load the non-pactor3 compatible bios.
There is no workaround.

That's the only real answer other than eschewing Pactor 3

my question was about digital radio I use for recreational purposes and I am
a radio amatuer.....!
I,ll try the UK group.

cheers

Tony.

Hi All:

Many hams here in the US view CB as a dirty word. Calling someone a CB'er is an order of magnitude worse than calling someone a lid. So any posting that mentions CB is going to get a bad reaction from many hams in the US. It's also true than many hams came to ham radio from CB here, but most learn to not talk about CB to other hams, as coming from CB is considered by many to be much like being a reformed wife beater, someone to be watched with suspicion until proven worthy.
So all the non US posters should be aware of these feelings hams here in the US have and not be surprised by the reaction that they get.

In this country, we can do without all the bad operating practices that they
bring with them.

Well yes, there's that too, but the main problems I've noticed have been poor operating practice and lack of respect for the PART97 regs. Many CB'ers in the U.S. cut their teeth on ignoring the law concerning their operation, and when they move on to Ham Radio they often bring that attitude with them.

If your wife or daughter was out on the road alone, late at night and had the car break down on her, would you rather she call for help on CB, or on the local Ham Radio repeater?

Last time I bothered to monitor 11 meters, there were a couple of hookers having a cat-fight on the air over who had territorial rights at the local truck stop. They were using language that probably would have caused ham radio equipment to poot out sparks and die on the spot. I wonder which one of those two floozies would have ended up making "Ham of the Year" if she had decided to get into Amateur Radio?

I'll have to admit though, that your theory about bigotry and ignorance being the root of the problem has merit, because those do accurately characterize a lot of what you hear on CB, here in the US.

There is, of course, bigotry and ignorance on the Ham bands too, but comparing the two would be kind of stupid, like equating a cap pistol and a 10mm automatic because they are both "guns". The problem is worse on CB, by many orders of magnitude.

Here in the US, even people who have never personally been involved in either Ham Radio or CB can tell you that Ham Radio is generally decent and helpful, while CB Radio is full of screaming ya-hoos and bigoted, ignorant nut cases. It's general, common knowledge brought about by observation.

The main difference between Ham Radio and CB (as it pertains to this discussion) is a matter of degree... Both groups have their share of great operators, and screaming ya-hoos, of course. - But the Hams have a wildly disproportionate share of the great operators while CB has only a tiny sample of them. On the other hand, CB comes out way ahead in the screaming ya-hoo department.

This goes far, in my opinion, in explaining why only a relatively small number of Hams are active CB'ers, and only a small number of CB'ers are active Hams. If the character of the two hobbies were not so different, there would be a lot more "cross-over" between the two, and Ham rigs for the US would have an "11-meter" position on the bandswitch that automatically put you in QRP mode (5 watts) on that band. The rig's display would then show "channel" instead of (or along with) the frequency. That feature would have been standard years ago, in the presence of significant "cross-over" between the two hobbies. - But there isn't any.

I know several great Hams who were and even still are CB'ers, but those guys are exceptional. Most US CB'ers shouldn't really be on CB, much less the Ham bands. - As any Ham or CB'er who is not trying to make some kind of bogus point will readily admit.

Charles, N5PVL

What software can I use to connect this unit to my PC?
I'm a new ham here, and this is my first attempt at packet and setting
things up. So any help would be great.

Thank you,

73's

Randy

Keep in mind that amateur radio, including packet, is just that:
amateur.

If there is any commercial involvement, you would need to get a
commercial license and transmit on a commercial frequency.

If you are looking for low cost off-the-shelf answers, and Internet
connections are available at all sites, another answer might be a Net
based solution. Periodic phone modem contacts might also do the job.

If you need to use radio, some idea of distance and other parameters

would be helpful. Remote could mean 10 yards, 10 miles, or 10 time
zones.

Happy trails,
Gary (net.yogi.bear)

YOu can use most any ascii terminal program to start with. Windows 95 and 98 have a terminal program that will communicate with the TNC. They will not do any of the fancey stuff so ou will have to type in the commands. YOu can run hyperterminal and go to its properties and change them to the com port you want to use with the tnc and the speed to match it.

There should be some pointers in the manual. My first TNC was an MFJ-1270B and I think they're similar.

If you don't have a manual, there are a couple online at MFJ's website:

http://www.mfjenterprises.com/man/pdf/MFJ-1270C.pdf

and

http://www.mfjenterprises.com/man/pdf/MFJ-1270c.pdf

When I started, I used a terminal program like the other poster suggested. The manual links above should give you some basic information on what commands are available. Hopefully that will get you started.

Bonjour,
Quelqu'un aurait il une petite idee sur le probleme suivant sur un ts820
Lorsque je passe en emission et que je reviens en reception il n'y a plus
aucun signal comme si le gain HF etait a 0. Au bout de 3 mm environ toute la
reception revient !!
Capa oui mais ou ??
Merci de votre aide

Can anyone point me to a site (or thread) that would help me
understand how to decode packets received on my scanner, then
connected to the mic input on my PC via the discriminator port on my
scanner. I know it has been done before and have had some success by
tapping into the bit stream using the waveIn* functions. However, I
am lacking the knowledge to "decode" the data at a certain baud rate
and making any sense of the bit stream.

thanks for any pointers (no pun intended)

Have you been to Southern California lately, Hank? I cannot judge which is worse: CB or the 147.435 repeater (the latter infamous for its users bad operating practices).

This may not be true everywhere, but it is certainly true here. Just turn on a CB radio and count the number of violations PER MINUTE.

Why do I have to travel there to hear the CBers?
I can hear them fine here.

What does this have to do with CB in the UK or Norway?
Your observation simply proves you live in an area with a large
number of ignorant idiots. But we knew that already.
Your observation has NOTHING to do with LEGAL operations,
which was the topic of discussion. Feel free to jerk your knee though ...

Hi for your information MixW 2.07 is now available for general release.. This is NOT a beta version for the full version fully de-bugged. Go to: www.nvbb.net/~jaffejim/mixwpage.htm and have a ball. Here are the changes:

MixW 2.07:

- SSTV Drag'nDrop
- Q15AX25 support. Note: Q15X25dll.dll is not included to the distribution due to licensing limitation. Download and install the dll separately.
- Resizing history bitmaps.
- MT63 manual tuning & secondary channel.
- MACRO <MARKERS:xx,yy,zz,tt,ww>.
- Auto-created macros like <WX?>.
- One level recursion like <CATCMD:PO<POWER>>.
- Friends file support <INIFILE,HI,?C>.
- Telnet echo on/off toggle.
- MT63 secondary RX, manual tuning.
- Set markers macro <MARKERS:1000,1020> (up to five frequencies).
- Transmitting pictures in MFSK16 mode.
- International characters transmission support, including Japanese. hieroglyphs. See menu Mode - Character encoding, UTF8, JIS etc.
- QslPrint executable allows printing a huge amount of QSLs and labels.
- Cabrillo support for BARTG Sprint and BARTG Spring (AKA BARTG-RTTY).

Best 73 and have fun..Jim, WA2VOS

Try searching for XPWare on the Web. That is an allmode TNC package that works
with most TNC's out there. Quite a detailed and easy to use program.

<babble babble>

Um ... CBers was the topic.
No problem hearing 'em here on HF.

Nothing to do with this thread though, since it was
about LEGAL CB operation using digital modes.

I just poked at the "anti-CB" bigots a bit ... and you bit ... and
took bit between your teeth ... and ran on and on with the diversion :-)

Point made, I'm gone, cheerio!

Everyone knows K2 rigs hear great and sound great. It should come as no surprise that on scope screens, K2s also look great!

Here is a link to a really gorgeous K2 Keying Envelope created with a high performance digital scope using deep (24 Million Sample) deep memory.

Very nice. Maybe a little sharp on the trailing edge, but that's about as good as it gets.

I am using a Rascal (like a Rigblaster). It isolates the sound card signals and does not mix them.

It appears that the sound card output signal is present on the signal sent to my software as sound card input. So, if I am sending CW to the Rascal, software that displays sound-card-in shows my CW.

It happens on different PC's, different Rascals, different operatin systems (win98 and XP) and different radios. I assume it is something the Windows controls are doing, or maybe the sound card itself (for which I have no documentation).

The MIC Volume Control in windows is muted, so it is not coming in that way.

Can someone shed some light? I would like to be able to adjust the amount of this pseudo-feedback higher. I like to decode my own CW and log it; this lets me do that.

It appears to come from the shielded splitters I have in the sound card jacks. Whe they are close, I get the feedback. When they are separated, the feedback becomes negligible.

Maybe I can run a lead from the OUT splitter to the MIC. Then I can unmute MIC in Windows and set the control low. . .

This should work with sound card radio. I have to mute MIC for normal sound card stuff, tho.

Continuing this conversation with myself, this does not work. The mic input seems to be ignored. I suspect the Recording Level option in Windows is esclusive: either Line or Mic, but not both.

In order to feed the sound card OUT back into the IN, a external stereo mixer would be required -- to mix the radio RX with the sound card OUT. Fortunately -- owning one of everything Radio Shack ever made -- I have one and will try that next.

There are TWO sets of level controls in the sound card software. Often to find them you have to click on properties or something like that.

You wan to turn ON your line in in the RECORD screen, but turn it OFF in the PLAYBACK screen.

Otherwise it will always output what it hears.

Recently someone posted the best way to unscrew and rewind a mini
digital video tape. Would appreciate your posting that again or better
yet sending the method to my email: bob@infocuscommunications.com
Thanks.

```

I am new to ham and want to send 1200 baud telemetry data.
I have a HTX-404 that I will use for the transmitter.
This is only going to be one way communication.
The transmitter modem will be built out of a PIC and use AFSK at 1200/2200.
The PIC will also sample analog signals and that is the data that will be sent.

My question is this:
Can I just transmit using an RS-232 protocol for bit timing?
Also do I have to create packets?

I couldn't find much info on how bytes are formatted and how packets are formatted.

As for sending my call sign, would I be able to send it with my protocol?
I can just send it with morse code easy enough.

Thanks for any info.
Robert DeHate

I must be a moron because I can't remember this.

If I want to send a 700 Hz CW CQ at, say, 144.200, but am emulating CW in SSB, what should I set my USB frequency to so that hams listening for CW on 144.200 will hear my 700 Hz signal?

---------------------------------------------------------------

Set your radio dial 700 Hz lower than 14,200.000, namely 14,199.300.
That becomes the frequency of the suppressed carrier, and on USB, the 700
Hz tone will be added to it, giving you 14,200.000.

If you were doing this using LSB, you'd set your radio 700 Hz higher and
the tone would be subtracted.

It occurs to me that there's a possible problem there. If the sender is transmitting on exactly 14,200, and those listening set *their* rigs to that frequency, then (assuming identical rigs), the signal would be inaudible down in the zero-beat dead zone.

A better idea is to set your rig on 14,200 and use a 700Hz tone, so that you're transmitting on 14,200.700. That way, if the receiver is set to 14,199.300, they will hear a 1400 Hz tone and still know you're there.

This is, of course, a *very* old debate, frequency vs. suppressed carrier frequency vs. actually frequency. Some services use the center of the passband as the nominal frequency, while others rely on suppressed carrier frequency. Most Ham rigs automatically offset their "carrier" frequency ~700 Hz from the true transmit frequency so that operators who tune for a 700 Hz note will match the transmitting station's frequency.

HTH.

Bill

No, it would still be audible because the BFO is always offset. Otherwise reception would not be possible on that or any frequency. Setting the BFO right in the center of the bandpass doesn't work and nobody does it. That's true whether receiving CW or SSB.

I have a KAM that I bought a lot of years ago. Through the years I have upgraded the microprocessor and now it has KAM-E 7.0.

I stopped using digital a few years ago. Now I have decided to enjoy digital once again. I made, and then bought an interface to use with my computer's sound card. This enabled me to run PSK31, RTTY and SSTV, which work very well for me. However, I would like to run Pactor and Amtor again. I find I cannot do that with the sound card except on receive in some cases.

So, I have some questions about putting my old KAM back in action. I know that Kantonics has upgraded to new models of the KAM and I wonder if I have an obsolete unit. Can my microprocessor be updated from the KAM-E 7.0? Also, can SSTV and PSK be run on the KAM? If not, I guess I could make a switching system to go from the sound card to the KAM.

I checked the Kantronics Internet page but find no reference to upgrading
the older KAMs.

Any assistance would be appreciated.

Thank you. I will print this out and stick it on the radio.

What about listening? Assuming I am TXing on 144.199.300 in order to
reach CW listeners tuned to 144.200, what USB frequency should I

listen on? Should I use split VFO and listen on 144.200 USB?

You have it correct. If you want to simulate a cw signal using ssb then you inject the tone into the mic jack that you want to receiver to hear. That is if you the receiver is set to 144.200 , you set your transmtter to 144.200 an what ever frequency you inject in the transmitter mic jack will come out of the receiver.

It is when you transmitt cw by the normal method of turning off and on a carrier that you have to pay attention of where the transmitter is actually at in relationship to the receiver.

While not usually noted, most of the modern receivers are set to listen on the upper side of the so called carrier frequency so the transmitters are also set that way. Some of the transceivers will even have a cw "reverse" position on them. This is where the dial frequency vers the true frequency of transmitters and receivers become confusing.

I am not sure what the hams find interesting, but the technology is useful. Many emergency vehicles are now equipped to report their position, and a

dispatcher can look at a realtime map to tell exactly where her resources
are when allocating them to a call for service.

Like LEO's, UHF/VHF repeaters, and packet, hams were playing with the
technology before it became widespread commercially. In many cases, the
ability use the technology is more satisfying than the actual application.

I'm not sure that's an accurate observation - fleet management
has been around longer than APRS.

In Digipan go to Configure, then click on Band, next check either USB or LSB
for each band. The band frequencies will now appear on your screen.

I'm new at this too and just figured this one out.

APRS is much much more then the AVL portion.

I've learned the hard lesson that if a significant number of folks are doing something and finding it rewarding and enjoyable - then there is probably something there. What I'm finding really hard is applying that rule to golf...

73,
Bill WA7NWP

It has been quite a long time since I have been on packet, actually about 7 years. But I pulled everything out the other day and hooked all up on 2m and HF. Seems to be working fine, but it seem like I could unproto or digi a beacon through another station. I must have a conflict set up and it is just not working. Is there anyway someone can email me there Display files on there Kantronics so I can have a look of what I have got set up wrong.

Thanks in Advance,

Scott Gordon

Korean War. APRS is basically TADIL-A (military datalink) without
the NCS (Net Control "master" Station) polling all the PU's
(Participant "slave" Units), and displaying the symbols on the radar scope.

Leading edge, for ham radio right now.

The technology is there, but building the stuff takes some dedication.
I've had my sample vocoder chips for over a year now, and my Digi-Key
catalog open to the Surface Mount adapter page :-)

Basically, a 9600 baud capable radio (direct FM input and output)
and a vocoder device which packetizes the digitized audio.

9600 baud is probably the minimum quality voice speed, and would
interface to a new binary APRS protocol well.

I've heard 2400 baud vocoders, and while bottom-grade, they might
be interesting to do in non-DSP designs.

Like other forms of packet, the people who enjoy it the most are the
programmers, and the radio site construction folks. Mere operators
probably get bored rather quickly, unless there is a lot of local activity.

> Well, it's nothing for me to feel bad about, I suppose... I can see some

You said that already, and it was just as boring the first time.
Did you have something to say about Ham Radio?
Do you have a license?
Sounds a lot like what I hear on 28.605 ... that you on there?

Pot calling the Kettle black in the same sentence.

> I stand with my first, although crude statement
> FUCK off and die you ASSHOLE!

Well, I hope you feel better now that you got that out of your system.

> No one supports your constant attack on fellow hams for simply
> discussing ham radio topics.

Fine, fine.

> No one can hear the voices in your head but you.

Fine, fine.

> feel free to join the Charlesb is an ASSHOLE club.

Becoming an adult requires that you develop a personality that
is completely your own. Not something you saw on TV or in
the movies. Why would an adult want to join such a club?

> Everyone has someone in their family who is crazy,
> if you don't know who it is, its you!

Your signature block marks you as someone that adults would not

want to associate with. Find a good women/man/animal, and develop
your mind in positive ways. Relax.

Well, if you want to see real usefulness to APRS, just spend a day or two with any kind of cross-country racing event such as bicycle, boat or horse races. When you are the event communication manager trying to keep track of and dispatch 10 or so support vehicles and medical teams over a course covering several hundred square miles, suddenly APRS becomes a very valuable tool.

I'm sure you are thinking "what does this have to do with ham radio?', well just take a look at part97 where it talks about the purposes of ham radio, and don't skip over the "public service" part.

I was not getting ready to coordinate 10 or so support vehicles for a
special event, when I checked out APRS. I would imagine that only a tiny
minority of APRS users do. No, I was just looking at it from the regular old
ham perspective. Like many hams I heard about APRS, hooked it up, took a
look at it for a few days, and then wondered where the fun was supposed to
be.

Well there you go, being sure as to what somebody else is thinking... (Hint: It's a sucker bet.)

I don't have any problem with APRS being around. I thought my post made that clear. After checking it out though, I decided that it was not for me. Lots of things to do in ham radio, and we all decide for ourselves which ones we want to invest our time and money in.

I have a feeling that APRS will not decline and fall due to my personal lack of interest. Lots of other hams are interested in APRS. Have you seen a USA APRS map lately?

If APRS goes into some kind of weird slump and starts to fall apart because I moved on to something else, send me an e-mail and I'll look into the situation. Until then, maybe you should kind of drop out of panic mode and take a trip to chill-down town.

Sheesh! Some of you guys are worse than old ladies!

Charles, N5PVL

Why the hell would anyone use a digipeater for anything? They suck.
Digipeating a beacon is a pretty shitty thing to do anyway.
Most people turn off digipeating because of assholes that beat on
someone else's hardware with meaningless beacons that nobody ever
reads.

Digipeating is a no-no with the old style stuff... Things have come a long
way since then.

http://www.afthd.tu-darmstadt.de/~flexnet/

Now days, with modern software, digipeating is preferred over the old NetRom
system. There are places now where if you don't digipeat, you are considered
to be a jerk because you are tying up the freq with the old, slow way of
doing things.

This is not the digipeating you are familiar with though, being a bit more
advanced. Read up on it, if you are interested. I doubt that you really are
interested though... You sound like another whiner to me.

Obviously, Perry is more than qualified to comment, being quite proficient
at acting like a rude loudmouth.

When you say that it is fine as long as the digital voice is not encrypted

do you mean that encrypting voice is against the law? Or would it just
take too much bandwidth?

I've heard 2400 baud vocoders on the Iridium phones. I agree that
they sound extremely "bottom-grade". 9600 would be as low as I would
like to go.

I have only seen pompous bloating about oneself.  QST had a few interesting
tidbits here and there.  Nothing to around that would proclaim him to be a
god. Nor do we go around worshiping Mr. Cerf during every day internet
usage.  Get real.

Well,

Law enforcement is included in the general public. Amateur radio is not
supposed to provide services that a commercial provider can demonstrate.

You can go to court and try to argue. Since you will only be going to an administrative judge when the FCC is involved; said judge would not give your dream much latitude. You're just wasting time and money to argue nonsense.

You want to keep the thing going when you are wrong. I love all the emails that I get about N5... I don't have time to respond on a daily basis.
Will keep in touch

bill

Yes, the encryption of amateur signals (hiding their meaning) is prohibited by Part 97 (I'd have to look up the exact subsection number, but it's there, trust me.) and also in the ITU Radio Regs.

73,
Carl - wk3c

Hams are, in exactly the same way, included in the general public. That
hook just won't bite, but you can keep trolling anyway.

It is ok with me if it is not encrypted. I would mainly want digital to clean up the static in some transmissions. I am thinking about raw data (similar to audio CD's) with some error correction coded into the bits.

Justin Time wrote:

> Well, if at first you don't succeed� I have been trying to get an APRS station up and running for a little over 1 � years now without success. The equipment consists of a Kantronics KPC 3 +, a Yaesu FT-50RD, a Radio Shack HTX-202, Diamond omni antenna at 25 feet and various computers. I registered a copy of WinAPRS and am running that on a 1.2 GHz, Windows 98 SE, 40 Gig HD, 256 Megs RAM machine. Everything runs fine except nobody can decode my packets. The red transmit light comes on, the HT sends out a packet (I can monitor that on a different HT) but all it amounts to is a burp of noise. The only

I presume you are within service range of a WIDE or RELAY, and know how to set up your UNPROTO path so that a WIDE or RELAY will echo your packets, and you are decoding those repeated packets yourself.

I would make the TxDelay ridiculously long (say 1 second, which probably means setting TxDelay to 100 on your sotware or TNC (not familiar with either) as most things set TxDelay in increments of 10mS. If that worked you should be able to hear the substantial period at the start of each transmission where the system is just sending the same character (frame character) before the packet itself which will be short, but sound more random.

Next reduce the modulation level to zero and inch it up until something decodes your packets. Hopefully you will have some joy. Once you have that working you can explore the range in deviation that seems to work, and reduce TxDelay to something shorter that works reliably.

HT can have awful slow tx key up time, so a long TxDelay is the way to start and work it downward.

Common mistake is to overdrive the audio, which causes severe limiting in the HT's audio limiter, which is usually after the pre-emphasis circuit, and so effectively wipes out the pre-emphasis. Err on the side of low deviation. I can receive signals below 1uV with just 1KHz peak deviation, but I cannot receive half the stations in this town at any strength because of gross overdriving of the audio.

I hope that at the end of all this, you aren't disappointed with APRS. Still, you will have learn't something along the way and that is more important, isn't it!

As always, should you choose to accept this mission....

Cheers... Owen

PS: it is very easy to calibrate a FM demodulator if you have access to an SSB receiver (to either listen to the tranmitted signal directly or sniff a bit of IF from a receiver) and understand the procedure for calibration using Bessel zeros.

Hi fellow Amateurs,

Just created, for Hams only, a brand new Classified Ads Site. Totally FREE.

Send your ad to over 1500 other sites with one click.
Many categories. Take a look, tell your local hams and radio clubs.

http://cybertechworld.com/ham.htm

Oh and one other thing.....Have a great Christmas and take care.

73, Lee, VK4CXX
Brisbane, Australia.

Yours Sincerely,
Lee Asher
Brisbane, Australia

How would you go about TXing the morse Post-code if this were the rule on VHF amature packet?
I,m thinking you would have to have a TNC.......... not say a baycom unit or abe using a soundcard interface.

I assume a "CW-ident" feature either in the TNC or software would be needed....

In fact is this possible (easily??) or very much more complicated (it seems) than just a beacon with your "mycall"

The Secretary of State hereby gives notice pursuant to section 1(4) of the Wireless Telegraphy Act 1949 to holders of the Citizens' Band Radio Licence ("The Licensee") that, with effect from 20 December 2002, each Licence shall be varied as follows:

1.. In this Notice, "the Booklet" means the Citizens' Band Radio Licence Terms, Provisions and Limitations Booklet RA369 (REV 1), the terms of which form part of the Licence.
2. As from 20 December 2002, the Licence shall be read and construed as if:

(a) the following new sub-clause 2(c) were inserted as follows:

(c) in the following modes:

    1.. unattended operation of a CB station;
    2.. operation of a CB station in digi-peater mode or node operation;
    3.. operation of all mailbox and bulletin board systems;
    4.. interconnection with the Public Switch Telephone Network (PSTN)

(b) a new Clause 12 were inserted as follows:

" Operation by the Licensee of data on a CB station"

12. Operation by the Licensee of data on a CB station is limited to a one-to-one operation, which does not include digi-peater mode and shall be on the following basis:

    1.. the channels shall be used in simplex mode only;

    2.. the data unit interface with the Wireless Telegraphy apparatus forming a CB station shall be made only though the external microphone input socket and/or receive audio/speaker output socket with the aid of suitable cables/switch;
    3.. the data modulating the transmitter shall be the AX25 Amateur Packet Radio Link Layer Protocol;
    4.. the class of emission shall be G2D. Only two tones shall modulate the (said) transmitter. The maximum frequency of the highest tone modulating the (said) transmitter shall be 2200 Hz. There shall be not more than 1000 Hz frequency between the two tones. If a connection is not established within 20 seconds, the transmitter keying control line shall be reset;
    5.. the Licensee shall transmit their full postcode in Morse telegraphy:
    1.. at the beginning and end of each period of communication;
    2.. at the end of each interval of 15 minutes, when the period of communication is longer than 15 minutes;
    3.. at the beginning of transmission on a new frequency (whenever the frequency of transmission is changed); and
    4.. on the same carrier frequency that is being used for communication.

thx in advance

Tony

And questions or discussion about CB radio (in or out of the United States)
has *what* to do with Amateur Radio?

It is very simple if you run a TNC, just a single command like "CWID ON".
Perhaps someone else can comment on the Baycom and sound card situation.
At least in the US, CW ID is no longer required, an ID in AX.25 UI is allowed.
Have fun with packet!

If you get an Amateur Radio license ... there is even more fun ...

I read somewhere a few years back about a way to cram two separate binary images into one EPROM for a TNC2, with the ability to switch back 'n forth between memory addresses with a jumper - something like that.

Now I'm wanting to try that, but I can't seem to find the info. Can anybody tell me "where to go"? I have access to an EPROM burner but need to find out what the drill is, in order to do this dual image thing.

Thanks!

Charles, N5PVL

Thanks Hank,
I,m sorry to have caused so much trouble.It was a genuine question about
packet rather than C.B.
Many counties in Europe have had packet radio on CB since around 1992/93. In
fact some "cber" have written packet programmes and at its peak \I belive
25-35,000 stations were on the CB band.
Many schools in Germany had a PR station and a whole net -work was in use
maybe it still is.

I belive many of the stations in Amature radio now and maybe in the future
were introduce by the use of CB and PR/data/ 11mtr SSB.....etc etc

Over here in Europe anyway ......

I,m sorry if I have caused offence by posting the above question.....

Have a great 2003
Tony.

I think you just bend-up the MSB pin on the address bus, and
either ground it, or apply Vcc with a switch. 64k ROM would then
have two 32k ROM's switch selectable.

Paccom TNC's had this switch standard I think.

Hello

Someone told me you can reload the pactor-3 BIOS when your 20
high-speed pactor connects are used up. I tried, but there seems to be
an embedded counter or something. After re-loading old firmware, then
loading the new firmware, it still knows I have used up the 20 free
pactor-3 connects.
Any way to get around this?

73,

The only one's that take offense are the ignorant.

They appear to be unaware that there are services other than
Ham Radio that make use of digital networking ... legally ...

The phrase "Narrow minded bigot" comes into my mind
somehow ... wonder why :-)

In any case, have fun!

In article <RY9_9.126545$ui1.2384576@news1.east.cox.net>,
haldrige303@cox.net says...

> I think you just bend-up the MSB pin on the address bus, and
> either ground it, or apply Vcc with a switch. 64k ROM would then
> have two 32k ROM's switch selectable.

A better way to do it, IMO, would be to make a little adapter daughterboard that has two EPROMs on it, and a DIP header to plug into the KPC's socket. You could then switch-select between the two chips by controlling the CS (Chip Select) line.

Then again, that's me. ;-)

> This has previously been pointed out to you, but you have ignored it,
> apparently because the facts don't support your world view (or your
> troll, as the case may be).

Why don't you read the part, where it says broadcasting with intent?
N5PVL has declared about how he actually wanted to broadcast data to
the public. The data did not fall under any exceptions.

He wanted to provide equipment for the receiving end. This demonstrated
his intent. Information bulletins for emergency communications are
bulletins for the futherance of amateur radio. Keep reading the rules,
and you might get them correct.

> The relevent section, 97.113(b), reads "An amateur station shall not
> engage in any form of broadcasting, nor may an amateur station
> transmit one-way communications EXCEPT AS SPECIFICALLY PROVIDED IN
> THESE RULES" (emphasis added).
>
> 97.111(b) states: "(b) In addition to one-way transmissions
> specifically authorized elsewhere in this Part, an amateur station may
> transmit the following types of one-way communications...Transmissions
> necessary to assisting persons learning, or improving proficiency in,
> the international Morse code;... Transmissions necessary to
> disseminate information bulletins..."

I did a little checking, and found out that the guy is not even a ham.

He doesn't identify himself because he is a Troll, of course, and because he doesn't have an amateur radio liscense.

Charles, N5PVL

You're still claiming that the ARRL does not intend it's transmissions to
be received by the general public, I see. That demonstrates quite clearly
the validity (and rationality) of the rest of your thoughts.

http://www.eham.net/user/profile/KB1IUB

There's a picture here: http://buck.com/hampics/B/KB1IUB.jpg

He's a tech, and has had his license less than 6 months, which in his mind
qualifies him as an expert. LOL!

FYI, you won't find "me" as a ham, either. This email address is used as a
spam
attractor. I'm and extra, and was first licensed in the early '70's.

I've known some new hams who were really on the ball. Inexperience is nothing to be ashamed of, as long as you are ready, willing and able to learn.

William seems to be missing out on either the ready, the willing, or the able part... That's a shame.

So he decided to be a Troll, hardly what you could call an asset to the hobby. Hopefully he will grow into being a better ham. - Or take a hike.

Charles, N5PVL

Check http://www.arrl.org for a list of ham clubs in your area.
Contact said club. Any of the members who do the ham swap meet circuit
will most likely know what's local and worth going to.

Look. You can make the assumption. I am not talking about the ARRL. The ARRL is sending out information bulletins and items of use to the amateur community. IT is not a broadcasting station transmitting items of use to the general public. Don't put words on my mouth based on your speculation and assumptions. Perhaps if you read the regulations without all your speculation, you might follow the rules. ARRL's activities are within the regs. N5PVL's broadcasting to local law enforcement is totally outside regs.

You are the troll. I've used radio equipment for a long time. I have also worked in a public broadcasting station. I also read those "regulations" that are so conveniently ignored by you. You are so fast to jump the gun that you thought I was not even licensed. You are always out making decisions without any consideration. Just think about how many of prior statements were wrong. N5PVL, I have displayed my callsign several times. Why don't you even read the regulations? I would like to let you just because someone agrees with you, doesn't mean you are right.

My original post was about how you are a horrible person along with another individual. You do nothing to help others and spam like a troll on any question posted on this newsgroup. Lots of people are watching you. I have received many email comments about the lack of your civilty. I have also received in the messages about how you don't know anything about radio and I should ignore you.

You are not on the ball. You are only interested in boosting your ego.

Bill

Well, you're consistently inconsistent.

Part 97 defines broadcasting as "Transmissions intended for
 reception by the general public, either direct or relayed."

"Local law enforcement" is obviously not the "general public,"
so such transmissions would not be, by definition, " broadcasting."
It is obvious that you're confused about the rules spelled out in Part 97.

Charles has a colorful personality, and I'm sure we'd agree that we disagree very strongly about certain aspects of digital communications. However, on the topic of using Amateur Radio for one-to-many transmissions (multicasting of data), Charles is very much on the ball.

Conventional radio is a one-to-many mode. The use of it for one-to-one communications on a shared channel as the early BBS's did was not a great idea to start with.

Charles vision, with a few tweaks, of disseminating useful information to MANY fellow amateur stations at the same time is a very good thing.

Hello,

I'm very new to packet radio and I need to be pointed in the right direction. So far, I've been able to connect two computers together using Hyper Terminal along with my Kenwood TS-2000 (base station) and Kenwood TH-D7 (HT). Passing text back and forth seems to work well, but I would also like to transfer files.

Can someone point me to some software that will fascilitae data communications beyond sending text?

Thanks in advance!

Aaron Cardon

I agree with you. There is nothing wrong with multicast protocols. I was interested and following such protocols and streaming protocols many years ago in wired networking.

However, N5PVL has talked about sending to non amateur

bill

Actually he did not talk about SENDING TO non-amateurs.
He talked about benefits non-amateurs might get from those transmissions.
It is perfectly legal for non-amateurs to listen to amateur transmissions.
Several folks quoted the appropriate portions of Part 97.

The issue of multicast is totally different ... since the recipients
would be amateurs. Benefit might acrue to non-amateurs were
they to listen to the multicast transmissions (note: transmissions,
not broadcasts, amateurs do not broadcast) but that is no
problem, since it is legal for them to listen.

This stuff ain't all that hard :-)

It's true that I am a lot more comfortable with fiction than I am with technical articles. I just went through the RadioMirror article with a search 'n replace, and found out that every instance of the word "broadcast" could reasonably be replaced with either "transmission" or "multicast", depending upon the context. When I was finished, the article read much better and was more to the point. A five minute job, including updating the server.

Thanks!

Aaron,
Look for a piece of software called paKet 6.1 or 6.2 It has the ability to do file transfers and makes it easy to do them. It is a DOS program but is tooled to work under Windows. paKet also has a built in BBS that allows other to conenct to you while your not there and leave you msgs or send you a file..

73,
Jamie R. Dean - W4JRD

...and here's Howard to present the TAPR viewpoint. Zero content, with an amateurish attempt at a personal attack being the main "point" put forward. Howard made no attempt to bring the discussion forward because that was not his intent.

This is what many hams have come to expect from TAPR. Protocol wars, elitism, and the "not invented here" syndrome.

I suppose you understand, Howard old buddy, that you can take your TAPR attitude and stick it where the sun don't shine. It is contrary to the spirit of the hobby, (though typical of TAPR) and as TAPR's track record so amply demonstrates, your attitude does nothing to advance or support the hobby.

I have very little continuing interest in the digital modes.

No longer working on any projects, shutting down the existing

links as the gear dies. There is too little interest from the general
ham radio population to make it worth my time and effort.

Thanks Jamie! Thats exactly the kind of direction that I needed. I'll give it a try.

I would also appreciate any other software recommendations that others may have. I'm definately interested in BBS features.

73,
Aaron Cardon

Yes, it really is a shame... I put forward a serious proposal that was relevant to advancing the hobby, and there were so many brainless attack posts, a rational discussion of the proposal was impossible. On the other hand, I intended to announce the proposal here, not discuss it. There had already been a discussion on QRZ.com prior to my announcement here.

Well Packet isnt ideal for graphics heavy interent surfing, I dunno if the regulations are setup for that anyways, but packet is good for chatting & text messages, that sort of thing. I've tried it a bit on my HTX-404 (A radio shack 70cm handheld) and that seems to work ok, My "tnc" is actually a Baycom bp-2m which is little more than a modem and the computer software does most of the work of a tnc. Not too bad, and an inexpensive setup. Now if I could just find a few hams on 70cm doing packet in my area.

I am new to the world of amateur radio and I was wondering if it is possible to send and receive digital voice transmissions in the 2 meter band. Are there any mobile or handheld radios that would be able to encode/decode digital voice conversations in real time?

Yes, any type digital voice that is not encrypted is fine. You could buy a Motorola APCO-25 are any other type of digital radio that is capable of operation in the ham bands. Alinco has a poor quality digital card for their radios for 144, 220 and 440 MHz.

And that is a problem. We badly need integrated modem/radio solutions
for the digital modes, but what we have is still basically the TNC2 in
one form or another ;-(

For your amusement: that Alpha TNC2 card that I played with
way back in MA days recently gave up the ghost. It was in
a node on a 4000' mountain in the Gorge. It is now somewhere
in the woods ... think it got frisbeed when Terry had to take his
snow cat up there to replace it. Long service life.

The most recent project is SNOS, kinda like a cable box + ISP.
Considerable interest locally, think there are 13 or 14 systems online.
Does AX.25, NET/ROM, TCP/IP, links the BBS part to SMTP/POP
and NNTP. Was a fun project but does not have much future, since
it is DOS based code. The idea was based on the concept of "free
computers" which has worked out ok, but lots of folks don't want
to have a junker pentium machine sitting in a closet ;-(
```

Mostly working DX and contesting until the sunspots go away.
May get involved in some of the DSP stuff, may get back into VHF DXing.

Might be interesting to start some kind of meeting place on HF.
Long long ago there were a bunch of BBS sysops that got together
from time to time on 20M SSB to chat about the state of the art.

The point to multi-point protocols have been talked to death it seems
to me. Not a lot has born fruit. This is too bad, probably something
interesting could be done in that area ... but again there is that lack
of interest from the general population of hams.

We have quite a bit of interest in simple networking from the local
RACES / ARES groups, but they seem firmly stuck in 1984, and are
constructing "networks" of KPC tncs, and expecting the built-in BBS
to be useful during emergencies. Kinda fun to watch them run tests and
get half a dozen messages posted ... and think they had some success!
Then they go away for three months until the next test ...

Good morning all,
I have obtained an old For corners Corp eprom
burner, this is about 15 years old. model vpp -1512.

I am trying to locate a copy of the original software, or an updated version
that I can use with this burner.

Any help with this would be appreciated.

Best regards

John Couch vk3jd

I have built a really cool interface for both of my xceivers but when I
run digipan I get either a blue background with yellow flecks scattered
(I presume this means no transmissions) or a screen nearly full of
equally spaced yellow narrow vertical bars. In this latter case, I
think these may be stations transmitting but the translation is pure
gobldy-gook, i.e. it looks like words (maybe) but the characters are
standard ascii and extended ascii set. Why can I not get a good
translation or are these NOT really stations transmitting psk31?

Ron

I wasn't going to jump in here, but......

In spite of vigorously disagreeing with Hank on a lot of things, I think that a quick search on his callsign will educate you on exactly how much influence Hank has had on the packet world in the past 2 decades. Suffice to say, if you have to ask, then you know absolutely nothing at all about Amateur packet.

The equally spaced yellow bars are probably some form of interference or noise. If they are there all the time and do not individually come and go, you're looking at noise. I get the lines on some bands, but not on others. Some of the noise I get comes from computers in the shack, but some of it appears to come from the house wiring too.

I used the freqs you see when you go to "Configure" in Digipan and choose "Band" as a guide to look around for signals. I put those freqs into my HF rig's memory so I could easily check around for PSK31 signals. Most of the activity is around 14.070 Mhz. I use USB, others say only LSB is good, still others say it doesn't really matter. Maybe someone more knowledgeable or least more opinionated on the matter will comment on that.

From my location in the southern tip of Texas, I can monitor QRP stations on 30 meters, a healthy crowd on 20, and morning DX on 15 and 10 M. I don't see much happening on 80, 40, 17 or 12 meters from here, but that's probably due to my downtown area "stealth" HF antenna setup. If my station was out in the sticks and had more metal in the air, I'm sure I'd be able to hear a lot better.

I get the yellow bars the worst on 20 meters, wouldn't you know it? I've discovered that I can operate there despite the inteference but prefer not to, so I drift around the other bands a lot, depending on conditions and the time of day.

Hope this helps!

Charles, N5PVL

As part of trying to help another ham troubleshoot his installation of RadioMirror, the terrestrial multicast Server/Client software for hams, I decided to borrow a KISS TNC (I already had one) so I could set up both ends of it from scratch and remember the pitfalls, hints and kinks involved in getting it up and going.

RadioMirror is an advanced digital file server for hams that distributes files simultaneously to an unlimited number of client stations. Here's an article about RadioMirror, with the relevants links and a proposal for utilizing RadioMirror as part of our emergency digital communications:

http://www.uspacket.net/l_ecom01.htm

I set up Server and Client stations, and transferred several files for a short test. My wife wanted her laptop back, so I was limited on time.

The system transferred several text files from 2k to 50k, an HTML file that was 60k, and SLEEP.COM, which is a small executable utility.

One file I tried to transfer never made it across though, even after three attempts. It was a WinWord2000 DOC file about 35k in size. The DOC file always showed on the RadioMirror Clint to have a "hole". (RadioMirror fills in "holes" in partially recieved files when it hears them transmitted again.) The DOC file had one "hole" in it but it never filled, even after three tries.

Any ideas as to why this would be so? Everything else went across just fine.

At 1200 baud, RadioMirror keys up for seven seconds, off for 1 1/2 secs, then back at it again. If you experiment with RadioMirror, run your Server's transmitter at low power, so you won't burn it up!

Charles, N5PVL

Here's a hint for trying our RadioMirror. Hook the two systems
together through a null modem. No TNC's are needed. When that
works, then add TNC's and RF to the equation.

I've had problems with corrupt files. I don't know if it's something
I introduced in my new version or if it was an existing feature.   I
need to spend a few minutes on it to figure out what's happening.

Anybody interesting in "testing" a version of RadioMirror that doesn't
run at 100% duty cycle, drop me email and I'll send you a link to
where it's available at.

Seems to me that would, at the least, depend on the radio. I have a TX that is not computer controlled and I just get the 1000, 2000 myself. Can't figure out how DigiPan would be able to figure out the frequency on my radio.

Forgive me if this post is off topic; I wasn't sure quite where to post. Packet radio seemed the most closely related.

I've been put to task researching satellite based telemetry systems - transferring small amounts of data from remote locations back to a central processing point. If the system being researched were to be produced, it would be a low-volume affair using OEM parts and systems.

I could use some help getting started in the right direction. Who are the major data satellite service providers and who are the major producers of satellite telemetry transceivers?

Anything you could tell me would be most appreciated. Thanks in advance.

Hi,

Just acquired a Maplin TU1000 RTTY tuning unit but without any info. A Web search turned up only a reference to a review in the December 1986 Radio Communication magazine. I see the unit has an RS232 output and so presumably this can run with newer software like MMTTY. Can anybody help further?

I gave it a fair trial, and have since decided that APRS is one of those mysteries of ham radio. After checking it out, I can't imagine where or what the appeal of it is. There's my little house icon on the screen... There's the one for the local hospital and the digipeater. Neither of them are going anywhere, and the novelty of looking at the little icons wears away pretty quickly.

Then there is a trucker with APRS, driving around! He's heading NNW at 56 MPH. Now he's heading North at 64 MPH. What next?

There is a messaging system. I did verify that it works, but plainly this is a function that regular point-to-point stuff does a much better job on. On the other hand, I was just trying to talk to one person at the time. If I had been trying to get a short note out to everybody on the LAN at once, the APRS messaging system might have looked a lot better.

Hook up to a server on the Internet, and see hundreds of little icons from all over the country. (USA Map) It takes a little while, even with broadband access, but the screen gets pretty busy looking after a while, with dozens of little icons covering each other up in some areas. The number of them is impressive.

Well, it's nothing for me to feel bad about, I suppose... I can see some great applications for APRS, but what I see happening instead is pretty boring - to me. Obviously, it is not boring to a great number of other hams, though and that's what really matters. I don't get into high-speed CW QRP either, but it doesn't hurt me any that other hams enjoy fast CW QRP a great deal. In fact we all benefit from aspects of the hobby that we are not personally involved in.

Yes, but his question was what frequency does HE listen to and since he
is in the US, providing him the Euro frequency is useless information
since I don't think he can easily listen to European 2 meter APRS
activity here in the US.

TAPR still is incorporated (as a non-profit) in Arizona and has a
mailing address (forwarding service) in Tucson. There has been no sale
or transfer of the name and/or assets. Currently only one of the Board
members resides in Arizona (the president is in Ohio and other board
members are in several states plus Australia). The business office
moved from Tucson to Texas around 1995 or so and moved again a few
years ago (still in Texas).

I don't know who you asked to remove your code (this is the first I've
heard of it), but I'm willing to comply with your wishes and have just
removed it from the TAPR ftp area. The web site does need some
updating (I believe this is being done).

Bob Nielsen, N7XY

Yes, TAPR was essentially the victim of a hostile takeover by a clique
within TPRS, the Texas Packet Radio Society, quite a while back. I edited
TPRS's "Q- Report", their quarterly during part of that era. The present
treasurer of TAPR was TPRS's treasurer then and probably still is. Several

BoD members crossed over that way. TPRS, incidentally, is presently even more of a dead duck than TAPR.

The thing was essentially orchestrated by Greg Jones, former president of TPRS, then TAPR. Greg is an active little stink, if nothing else. The only problem is that organizations that he heads tend to become extremely cliquish under his leadership, goes downhill slowly while he's there, along with a general loss of mission, then falls rapidly apart not long after he moves on to the next screw-up.

The pattern appears to be that he leaves the most destructive members of his clique behind to make sure nothing prospers in his absence. I suppose he thinks it makes him look good, since most people do not know his history. Greg went away, and now it's going all downhill... Boy, Greg must have really been a great administrator!

Riiiiight.

This is what happened to both TPRS and TAPR, at any rate, both on his watch. (And the aftermath of his watch.)

The TPRS web site is even more moribund than TAPR's, listing over 90 nodes in a system that actually now has maybe a dozen still hanging in there. There is a BBS list that is close to a decade out of whack.

I recently asked the president of TPRS if they are planning on trying to rebuild TexNet, or do something else like FlexNet so that Texas would once again have a functional network. He suggested a new statewide packet radio organization. I had to ask him because other BoD member's email addresses listed on the TPRS web site were out of date, no good.

TAPR may recover from Greg's "leadership" someday, or maybe not. They need to dump Steve Stroh, and about half a dozen others. On the other hand, it may be that we will someday hear the same thing from TAPR that I just heard from TPRS.

Thanks much Bob!

Every now and then I get a question about it, and have
to explain that I no longer support those old versions, and have
not supported them for either 6 years (MB) or 12 years (CBBS).

Asked several different folks, including a past president ... who
basically told me ... lessee need to be polite here ... bug off because
they would put whatever they wanted into the distribution :-)

That old code is still lurking on dozens of web sites though,
so suspect I'll continue to get the occasional question about it.

One more question: how does one update the packet BBS list?
The organization listed for Oregon no longer exists, and the data
is about 8 years old and mostly incorrect now. There probably
isn't anyone keeping such a list anymore ...

Here is an article I recently posted at http://www.qrz.com and at http://www.uspacket.net . The QRZ article has discussion, the USPN version is easier to read and looks better.

Emergency Digital Communications - Another Angle

- by Charles Brabham, N5PVL -
- U.S. Packet Net -

In the last decade or so, amateurs have been treated to hundreds of excellent new programs and protocols that have greatly expanded our capabilities. APRS, CLOVER, PSK31, PACTOR II, FlexNet, and AGWPE immediately come to mind. So many new ideas have been presented in this way, it is inevitable that sooner or later, something really great would end up being overlooked. This has been the case with RadioMirror, the Terrestrial Multicast protocol/software package developed several years ago by John Hansen, W2FS.

RadioMirror works much like the familiar EMWIN weather data and alert broadcasts provided by the National Weather Service. One transmitting station provides information to an unlimited number of recieving stations simultaneously by means of a digital broadcast to many stations at once, called a multicast.

Before reading about applying RadioMirror and its multicast protocol to digital emergency communcations, you can get a better idea of what RadioMirror is and what it does at the RadioMirror Home Page, as John can do a much better job of describing his work than I can. Here I will quote the major points of the system, from his pages:

RadioMirror is a new file server designed by John Hansen, W2FS (ex-WA0PTV), to use a broadcast protocol in packet radio. The current version runs under Windows 95/98. This results in relatively high speed file transfers from a central server to many client computers at once. Key features of this software include:

Packets are transmitted in unconnected mode so they can be received by an unlimited number of stations at the same time.

File transfers are faster than on traditional connected packet connections because the server need not wait for acknowledgment packets from the clients. Data streams out of the server without interruption.

The system does not require users to purchase any new hardware. It is capable of transferring up to 20 MB of data per day (assuming 50% compression) at a transmission rate of 1200 baud.

The client software saves partial files that are received with holes and fills in the holes as the file is retransmitted.

The client software keeps track of the file modification dates and will update files that have been modified, but ignore files that it has already received and have not been updated.

Unlike the PACSAT broadcast protocol, the filenames on the clients are exactly the same as they appear on the server, making this an excellent mechanism for distributing HTML files.

Entire directories and directory structures that reside on the server can be replicated exactly on the clients, making this an ideal way, for xample, for transferring files that have been downloaded from the PACSATs, so that stations that do not have satellite groundstations can still use groundstation programs like WiSP to access satellite files.

Hooks are built into the server to allow other programs, such as packet bulletin boards, to kick off server file transfers.

Files can be specified to be transmitted once, or on a continuous loop.

In practice, the RadioMirror distribution file gives you a copy of both the RadioMirror server, and the client software that picks up and decodes the data being sent by the servers' multicast transmissions. RadioMirror is designed to work with Win95/98, and both client and server programs require a KISS TNC.

What RadioMirror sends is files. Not only files, but directories can be transmitted by this versatile software to any number of recieving stations. Any kind of file can be sent, but HTML and text files may be the most useful for emergency communications.

RadioMirror and Emergency Communications

Obviously, there are dozens of potential uses for a supercharged amateur radio version of EMWIN.

I believe that RadioMirror can be especially useful for distributing information to non-hams that we work with such as Law Enforcement entities, the Red Cross, National Weather Service centers, Hospitals, and Government offices. Very few of these persons can be depended upon to learn how to use special software or radios, but they all know how to use an Internet browser.

All of these offices, along with local ARES/RACES groups and anyone else who is interested can be continuously kept up to date by a single RadioMirror server located in your community.

The RadioMirror clients at each location would require an old 486 or better computer to run Win95/98 and RadioMirror Client, the built-in IE browser set up with links to the files you wish to display, and a 2 meter FM reciever (any kind) capable of picking up the broadcast information. An old scanner, or ham rig that doesn't transmit any more would do fine. A TNC capable of KISS mode operation is also required for each location.

Once a RadioMirror client is set up, let's say at the Sherriffs office for example, an amateur radio operator is not required in order for the people there to use it. The client system does not transmit, it only recieves amateur radio transmissions and anybody can legally do that.

Radiomirror can simultaneously distribute the information you provide to any number of such client locations, freeing up your local RACES/ARES hams for more interesting and useful work. Most of the present setups, both digital and voice, require a ham at each location served so this is a significant advantage for small groups, struggling to do a lot with just a few active members in the field.

Once you have set up your server, start putting together a few client stations. You will want at least one of them right away, of course, to test the server. After that, assemble clients (as you can afford to) for the various non-ham agencies and entities that you have arrainged to serve.

Set the client machines for non-hams up so that when the power is flipped on, the computer automatically loads RadioMirror Client, and then the Internet browser with its pre-loaded links to the relevant file names in the client computer's directory. Create an internal HTML page with those links in the client computers' hard drive, and set that as the browser's default startup page.

If you power the reciever and TNC from the computer's power supply, they will automatically come up too, making it a single-button operation to bring up the entire system. This makes it easy to start over if things go wrong. You could even put the receiver and TNC in the computer's case, to keep things uncluttered and simple. The idea is to make it simple, easy to deal with during the course of an emergency, and obviously useful. A turn-key system.

Updating the Data on the Server

RadioMirror has no provision for remotely updating the information it will send. If you change the contents of the "continuous" or "one-time" directories, RadioMirror will send the updated files immediately. It is up to you though, to figure out how to update those files, residing in a computer at a node site. Probably the best solution is to run a copy of FBB BBS in the same machine, because of the extensive remote SYSOP controls and great security FBB offers. You can remotely do most regular DOS chores, and FBB handles YAPP and BinHex file transfers, another good feature for effective remote control of the RadioMirror server.

The BBS should have one radio port for control purposes, and be configured for high security (password access) along with minimal function as a BBS. If you want to use it as a regular BBS with additional radio ports, be sure your computer is up to the load that this will present while RadioMirror runs in the background! The BBS function is optional though, as you are primarily using FBB as a file transfer and remote disk control for RadioMirror.

Any other packet program that allows remote control of the disk, has good security and handles packet radio file transfers will do just as well, maybe better. I'm used to FBB, so that's what I tried.

You decide who gets the password and can update which files. FBB makes it easy to do this, too, with private directories. Once a file is updated, the updated version goes out over RadioMirror and that updates all of the RadioMirror client systems listening.

For example, hams at the National Weather Service E.O.C. could have control of a text file in a private directory in the BBS. In the RadioMirror server, you would have it send that file continuously, along with the files it sends from other sources. That way, whenever the NWS updates the text file, the updated version immediately gets out to the police, city hall and the TV station, and all other client systems that are operating within effective range of the server's transmitter.

Files can be created for each source of information, including amateurs in the field. They could either carry along a portable packet station, or relay thier reports over a voice repeater to a home station with both voice and packet capability nearby.

The RadioMirror server itself, it must be noted, requires a transmitter but no reciever. The transmitter must be rated for continuous duty, as it is only unkeyed very briefly and spends over 95% of its time keyed up. Reduce power, or get a pretty tough transmitter and set it up with a cooling fan. It will need it. If you start off with a 100 watt transmitter and tune it down to 20 watts or so, that would be a good starting point. Don't burn up your transmitter!

Going over the main advantages to this setup, they are:

A turnkey system for providing important data to non-hams and hams alike.

Frees up amateurs from babysitting voice or regular packet systems at non-ham sites, so they can do more in the field.

Is generally inexpensive, uses existing equipment and even equipment that is no good for anything else. (2meter rigs with no TX , no tone boards, and so on..)

Anybody with a TNC and a VHF reciever can recieve the multicasts.

Between Emergencies

To keep your system ready, the server should operate at all times, ready to be used for testing client systems at non-ham locations around the city. The clients will only see the files that you specify on their system's default HTML pages, so in-between emergencies, your group could transmit other general information of interest to amateurs, including "Ham Home Pages" for individuals and clubs, located at the server.

John Hansen describes some of these everyday ways to utilize a RadioMirror server at his web site, along with detailed information about the protocol, and the commendable philosophy behind this system. When an emergency arises, tell the system to only send the most vital files, so that it will cycle through them and update quickly.

Note: I haven't mentioned RadioMirror as replacing current voice and packet emergency communications systems because I think it works best when used to enhance them, not replace them. All of our ham emergency communications methods have a place in the hobby, and I believe RadioMirror really ought to be in there with the others because of the unique capability it offers to amateur radio emergency communicators.

How do you expect a group of PSK31 enthusiasts would react if some die hard CW enthusiasts would enter the group and demand that all long distance communication is done by manual CW ?

Manual CW as well as store and forward BBS packet radio have very little real communication value these days, except for some special cases. Both are mostly done for personal satisfaction these days. Trying to enforce your opinions on other will only produce bad reactions, there is sufficient spectrum space for different interest groups to work in parallel, if they do not want to work _with_ the other interest groups.

Hi Guys,
Need ya help once again.
Here's my problem.

I have a j-pole antenna on my window, the building doesn't allowed me to place it on the roof., the problem is, I could hear the packet bbs, and connect to it, but have a hard time getting data from it because of the distance. Is there a way or something I could do, to get a better signal ?

My system is a J-Pole Antenna and a HTX-202 handheld. I connect to a local system near me but they dont have any messages, or network nodes. Thanks..

A 2-meter beam antenna will give you better signal strength and better "hearing" too. It has to be pointed toward the station you want to connect to though, and the more effective the beam is (more elements) the fussier it gets about the aiming. A three or four element beam would make a good difference without having to be precisely aimed. Some apartment dwellers hang the beam from the ceiling, rather than try to put it outdoors.

You weren't really clear about whether your setup is having trouble "hearing", if it is trouble getting out, or both.

If it hears OK but doesn't get out well enough. (Excessive retries) the antenna you have is probably fine, but you need one of those little 2-meter RF amplifiers that will boost your output to 20 or 30 watts. It may be that your H/T just doesn't have enough "grunt".

As a ham, you should be aware that running underpowered on packet causes problems for other packet operators in your vicinity, and probably should not be done for any great length of time. Unless you are lucky enough to live where the local nodes have DAMA access, (fixes the problem) low powered signals cannot be heard by other packet stations nearby, and your two stations end up transmitting on top of each other.

Normally, packet stations can hear each other, and the software makes you wait for clear air before it will transmit. If they can't hear you, their systems cannot do this. Packet "collisions" result, downgrading the performance of other hams' packet setups, your nieghbors, and yours. It slows things down for everybody.

It's called "Hidden Transmitter Syndrome", because the low powered transmitter can't be "heard" by others, and that causes the problem. An amplifier or a cheap old mobile rig will probably fix the problem.

If you can't get out or hear well either, the station may be too distant for reliable use. VHF can only deliver so much range, and coverage area. You may be out on the fringe. This is where the beam antenna will do you the most good. In that circumstance, I would use a beam and an amplifier both, or try to promote a new local node that ties in with the others so you can go anywhere in the network with a short-range connect.

Finally, if you are not already using FlexNet, I recommend that you do so. The FlexNet packet software will boost your station's ability to handle poor or weak connection paths. It does it automatically, without your intervention.

This web site: http://uspacket.net/flexinfo/ is a good place to get a general idea about FlexNet, and has all the relevant links if you decide to try it out.

How does this scheme functionally differ from APRS?
I don't mean at the detailed protocol level; I mean at the
operational level.

Technically, APRS distributes small amounts of tactical
information on a periodic basis; RadioMirror is designed
to distribute files. Both of them use an unconnected
protocol which depends on re-transmissions to fill in
missing pieces.

What real-world emergency application would RadioMirror be better
at than APRS?

They'd figure he was a nut case for confusing two modes, and drifting so far off-topic.

>
> Manual CW as well as store and forward BBS packet radio have very

> little real communication value these days, except for some special cases.

Oh, you are here to display an ignorant, provencial attitude and bash packet BBS's... You must be here to support TAPR's view then.

Perhaps packet BBS's are no big deal where you live. In other places, they are popular but you just natually assume the the rest of the world is just like your local nieghborhood. They call that "provincialism".

You have come into this discussion acting as if you know what you saying, but the nature of your comments makes it clear that you do not. They call that "ignorance". The facts that shoot down your aguements are there to be seen, but you ignore them. Ignore-ance.

I'm not name calling when I say you are displaying ignorance and provincialism... I'm stating an obvious fact.

> Both are mostly done for personal satisfaction these days.

Yes, I agree that packet BBS's are, and always have been used by hams because they find satisfaction in using them. Your provincialism shows again in your assumption that because you personally are not satisfied with packet BBS's, then nobody else could be either. Elitist attitudes of this kind are usually rooted in provincialism and ignorance, and your display here bears this rule of thumb out.

> Trying to enforce your opinions on other will only produce bad reactions, there is sufficient spectrum space for different interest groups to work in parallel, if they do not want to work _with_ the other interest groups.

Yes, exactly, and that's why I felt that it was reasonable to expect support for packet radio BBS operations on a support group dedicated to packet radio BBS's. (TAPR BBSSIG) Instead, I got many responses from TAPR goons that closely resemble yours. Running down packet BBS's, ridiculing hams for talking about using them with amateur radio. Instead of support, hams get more of the same ignorant provincialism that you have displayed for us here today.

I appreciate you coming forward to demonstrate that ignorant provincialism and the elitism it spawns, Paul. Hams need to know where folks such as yourself are coming from when they hear you make your disparaging remarks about the hobby, attempting to lessen the enjoyment of that hobby for other hams.

In other words, on the TAPR BBSSIG, the "Trolls" are supplied by TAPR itself. They behave much like you do. If you use the BBSSIG as TAPR says it is intended to be used, TAPR folks break into the discussion to harass you, and discourage you.

"Support group" indeed!

TAPR runs a legitimate support group for APRS, because APRS is hooked up to the Internet, the leadership of TAPR's primary interest. (Too bad it isn't amateur packet radio) If APRS were all-ham (All done with ham radio) TAPR would not support it any better than it has ever supported packet radio BBS's, or even the idea of hams using radio. TAPR is a militant LandLine Lid organization, plain and simple, operated by people who are much like yourself.

You pointed it out yourself, Dana. RadioMirror is more flexible for sending information or data, and can send more. As you say, APRS "technically" can send small bits of information... RadioMirror is specifically designed for distributing information, it's not a side issue or an afterthought.

My proposeal is for a push-button, turnkey information system usable by hams and non-hams alike. APRS does not approach that, it does something different. The different systems - are different. DX clusters and packet BBS's both use packet radio and share some similarity of function, for example, but it would be silly to suggest that one take on the other one's specialized function.

I assume you have read the article so there should no need for further comment from me, unless you have another question.

Thanks Charles,
I'm gonna try the FlexNet program and see if that helps.  Where could I buy
the 2-meter beam antenna.  My problem is hearing the packet bbs.   I could
connect to it at times, but have a hard time receiving the data.

Thanks again,

  Rickie /  KC2KQQ

Alan's been hanging out in the parking lot again. He appears to spend a good deal of time there!

;-)

I suppose it must frustrate Alan. I was talking about someone else, but he recognised himself.

At the USPN web site, http://www.uspacket.net in the Links section, there is
a category for Retailers. There are links to several outfits there that you
buy from, either online or over the telephone.

I've used several of the Cushcraft 3-element beams over the years, and have
had good luck with them. I'm using an old one that somebody spray-painted
for VHF packet right now. MFJ is making a small VHF yagi too, now.

It's possible to build your own too, if you want to save bucks, or just for
the fun of it.

7db Yagi for 7 Bucks pdf file at this link from the ARRL pages:

>> Charles I want to warn you of something, e.g. this is the last post from
> Hey, that's great! Another Troll bites the dust.

You are the troll. You continously post one line comments on newsgroup threads. Other people put some thought into the matter and discuss things openly and in a polite manner. You just say, "another troll." In reality you are the troll. I would like to know if I have been on the internet longer than you. I bet that I have. I would like to know if you are stilling using a XT computer or if you have upgraded. Folks like you are keeping ham radio from progressing. You are only interested in your thing and pushing it on everyone else in order to satisfy your ego.

Enjoy your narrow vision of hamradio, broadcaster.
Too bad all you do is post on every newsgroup out there. I don't know when you are on the radio.

bill

> When folks come here all whiney, demanding, ignorant and insulting, I
> pretty well give them the back of my hand.

Oh really? You continue to insult everything. You have no right to call anyone else, "whiny, demanding, ignorant, and insulting." You insult any user that makes any post. You will not answer any question other than to say, "it is a stupid question and it is not ham radio related." Nor are you even capable to understand any message. You have demonstrated in repeated posts that you do not understand the prior post.

> The ones who denigrate any legitimate aspect of amateur radio get the
> old heave-ho as well.

You repeated talk about illegal operations and encourage them on this forum and other forums. Your actions are only indication of poor behavior and the signs of a poor ham. You fail to listen and listen and just continue to send babble. Continue on broadcaste because we know that your ego requires it.

> Hams (and non-hams) who ask polite questions or make polite statements
> are treated politely, yes even if I disagree with what they are
> saying, as long as they are not saying something detrimental to the
> hobby. (LandLine Lids, for example.)

No. You have not treated anyone with any civilty. You do not have any right to make the posts that you do. After seeing another post by you and Mr Oredson, I felt compelled to post.

> Anybody here can say pretty well what they please of course.
>
> ... Including me.

No. Life does not work that way. Nor do you have any right to infringe or impede upon the rights of others. You have no absolute rights and only maintain restrictions against the U.S. Government in regard to the violation of your natural rights. You can not denigrate and treat others in the fashion that you have continually maintained.

Bill

Just look at your signature. These are not the words of a ham radio operator. These are not the words of a polite and considerate human being. Your position in life appears to be destruction and the eradication of ham radio.

You, sir, are not supporting ham radio. You are only looking to destroy it.

PSK31 and CW are both radio.
What TAPR was doing was not radio, but internet only.

> Manual CW as well as store and forward BBS packet radio have very

The same can be said for PSK31, WSTJ, SSB, Slowscan, et al.

Looking for some advice..

I'm just getting into APRS. I have a few questions:

1) What TNC offers me the most flexibility (Weather, GPS, etc)

2) What Rig is best suited for APRS

3) As it has been a while since I've had a soldering iron in hand (sorry to admit),
    who makes cable sets to connect the TNC & Radio together?

4) Regarding software, is there a Linux solution or should I just stay with windows?

5) Any other pointers I should consider?

Any Kantronics (used KPC-3, etc).

> 2) What Rig is best suited for APRS

The Yaesu 1500 is new and cheap.

> 3) As it has been a while since I've had a soldering iron in hand (sorry to

Buy the Yaesu DIN cable option, and go to radio shack and put
on a TNC connector.

> 4) Regarding software, is there a Linux solution or should I just stay with
> windows?

Get UI-View32. I run VMware on Linux, and have a Virtual Win2k
and UI-View32 running. There is no native Linux software that is even
half as good. I run a lot of experimental stuff on Linux, but mainly because
there are good compilers, and database engines avaialable.
>
> 5) Any other pointers I should consider?

Make sure you don't try to cross the country in your digi string.
If mobile, use RELAY, TRACE4-4 or RELAY, WIDE4-4, and
for home, just use TRACE4-4 or WIDE4-4, and everyone will
be able to see you that matters. Don't make yourself a wide digi
unless you live on a mountain top, or there are no wide digis
within 40 miles.

RadioMirror was developed from the AMSAT multicast protocol that has been in use for quite some time.

On another newsgroup, I was recently asked to explain the didfference between RadioMirror and APRS, since they both use a multicast protocol, transmitting unconnected packets to a great number of users.

So, bright boy, when you imply that RadioMirror is "illegal", I suppose we must assume that you think that the AMSAT multicast protocol and APRS are both illegal as well.

Oh, and by the way, William... You are still an idiot, and aparrently a Luddite as well.

It's a real giggle when you accuse others of "holding back progress"... Could you do it again, sometime?

Charles, N5PVL

That was a good post, Alan. You ought to stick around and make more like them, helping out hams who are interested in getting started in APRS.

It would do you a lot of good to do so. - Get your mind out of that parking lot you appear to be so obsessed with.

Charles, N5PVL

Hello,
Regarding the transceiver, if you want something "plug and play", Kenwwo has 2 choices:

TM-D700 for the mobile
TH-D7 for the handheld.

They have integrated TNC, that may be configured to be operated without PC also.
There may be a cabe between GPS and TRX if you want an updated position each second or so.

I would not suggest using the TRACE paths except for when it is necessary to determine how you are getting to a specific point. It greatly increases the size of the packet as it goes out further. In most cases, RELAY,WIDE3-3 for mobiles and (digi name/call),WIDE3-3 should be sufficient to be seen over a fairly large area. Either of those should be enough for your signal to reach an I-gate, which will then feed your data to the internet so others can see where you are if they want to get online and look you up. In the Pacific NW, I see other stations from hundreds of miles away who are using these paths, and we are starting to recommend that people here use WIDE2-2 to help reduce traffic.

You may want to do an internet search for APRS New York to see if there is an established user group in your area. There may be specific paths they recommend or request be used for the network in that area, plus they may have a list of elmers near you who could give local hands-on assistance.

Yet you are the one that is trying to have receive-only stations manned

by professional law enforcement, salvation army, etc. You were even bold
to say that a ham was not needed. This is the public. You are
broadcasting to the public via your intent and audience. You should know
better.

ttyl Mr. Broadcaster...

Anybody can listen to Amateur Radio transmissions, moron. When Elmers give or lend a prospective ham an old HF reciever so he/she can listen to W1AW and practice morse code, he is "enabling" a non-ham to listen to a ham radio broadcast.

Scary stuff, huh?

Better call in the thought police!   (Obviously, your thought has already been "arrested"...)

Any other straws you'd like to grasp at as you go down? Any other weak-assed arguements to put forward?

I'm not quite bored with pointing out the obvious to you yet. How about objecting because the transmitter would generate RF? That would be a fun one to answer, too.

Charles, N5PVL

Generally speaking, Part 97.113(b) prohibits one-way transmissions
to non-amateurs:

�97.113 Prohibited transmissions.

...

(b) An amateur station shall not engage in any form of broadcasting, nor may an
amateur station transmit one-way communications
except as specifically provided in these rules; nor shall an amateur station
engage in any activity related to program production or
news gathering for broadcasting purposes, except that communications directly
related to the immediate safety of human life or the
protection of property may be provided by amateur stations to broadcasters for
dissemination to the public where no other means of
communication is reasonably available before or at the time of the event.

By the way, note that hams that call up radio and TV stations to report minor news
are often technically in violation of this paragraph, though I suspect it's
rarely enforced.

However - certain kinds of relevant one-way transmissions are explicitly permitted
under 97.111, including:

(b) In addition to one-way transmissions specifically authorized elsewhere in
this Part, an amateur station may transmit the
following types of one-way communications:

(4) Transmissions necessary to providing emergency communications;

(6) Transmissions necessary to disseminate information bulletins;

So, there doesn't appear to be a legal issue with the model used by RadioMirror,
though a single OO with a personal agenda could probably get a stream of letters
written
by Riley if they felt like it.

Not really. One point that appears to be consistently overlooked here is that the RadioMirror system I have described is a communication systems for hams. The fact that non-hams will find it useful to tap that source of info during the course of an emergency does not mean that it is intended solely for thier benefit. It just means that hams will have developed an information system that non-hams will consider it worthwhile to monitor, when other infornmation sources break down, are overloaded to the point of uselessness, or are pre-empted by FEMA during the course of an emergency.

Non-ham emergency workers will have a backup information system, and hams will get a lot of good press. Both will be able to do a better job, perhaps saving a few lives while they are at it. Those will be the main effects of the system during the course of an emergency.

In between emergencies (almost all of the time, unless you are very unlucky) the only people who will bother to monitor will be hams. (Maybe a few SWL enthusiasts.)

As I have mentioned elsewhere, both the ARRL and the FCC told me the system was legal some years ago. The PART97 rules have not changed much since then, and those changes have been toward loosening some restrictions, not making toward them more stringent.

Think of the W1AW broadcasts... For years prior to the no-code liscense, non-hams were encouraged to listen in on W1AW broadcasts in order to practice morse code for their liscenses. Obviously, hams who already had thier tickets had no need to practice 5wpm morse code. The 5 wpm more code broadcasts back then were specifically intended for non-hams. - As a public service.

We (as hams) don't have to feel worried about providing a public service, well within the bounds of PART97.

William's objections have nothing to do with ham radio or what is best for the hobby. He is just looking around for something to act ugly about, and is dumb enough to have convinced himself that he's found it. He's just another Troll, and a particularly stupid one at that.

I suppose he feels "threatened" by RadioMirror, as many felt "threatened" by APRS a few years ago. To that, I will say the same thing I said about APRS back then, " Gee, it only takes up a single frequency and can do a lot of good... I think we can spare that! "

Police, Fire, EMS and Salvation Army would only "monitor" such communications when normal communication systems are not available and therefore would be covered under ...

Sec. 97.403 Safety of life and protection of property.

No provision of these rules prevents the use by an amateur station of any means of radiocommunication at its disposal to provide essential communication needs in connection with the immediate safety of human life and immediate protection of property when normal communication systems are not available.

No, they aren't.  When they call, they are using the TELEPHONE, not amateur
radio frequencies.  As long as they don't SOLICIT the information that they
get/hear via amateur radio, there is no violation.  It says STATION, not
OPERATOR or LICENSEE.

I agree. My theory is that if regular channels of info are open (cell phones, Internet, etc..) non-hams will naturally use those regular channels of information. In fact, I don't expect any of those agencies or entities to care much about the system I have described at all until it is suddenly the only information system at their disposal.

One possible exception to this may be the NWS, who works with hams quite a bit anyway in some areas. In that case though, there is usually a ham on the staff at the NWS offices, or a volunteer ham whom works with them there. People who work for the National Weather Service are more aware than most other entities of the importance of backup methods of gathering and distributing information. They take it a little more seriously.

W1AW transmissions are intended for ham use only. You are encouraging transmission aim for the public. The intent is the requirement in the determination of broadcasting. Get out Part 97. Perhaps you will learn what ham radio is. You should also get a lawyer, as you clearly can not comprehend it. You will also need him to represent you at your hearing. So or later the FCC will find you and your broadcasting.

I haven't overlooked that point at all; my initial reaction, BTW, was to look in part 97 to see if the proposed operation falls into the permitted kinds of one-way transmissions. If a ham makes a one-way transmission *intended* for reception by non-amateurs, that *might* be an issue. However, Part 97 appears to plainly permit transmission of any kind of informational bulletins and clearly permits one-way transmissions in the case of emergency communications.
(Take a breath, Charles, I'm *agreeing* with you here... :-))

Of course, none of this addresses the functional utility of RadioMirror in practice. It actually assumes that information will be maintained as an HTML tree and updated using RadioMirror. It could certainly work but it's probably as narrowly focused as APRS in practice.

Does anyone remember ARESData ?

RGR, I noticed that a few posts back. It seems to me that it wasn't the first time, though we have often disagreed on other points. There's nobody that I agree with all the time, and that is counting myself.

It appears there is only one person on this newsgroup who really disagrees, and he has made it obvious that he is only doing so in his capacity as a Troll. All of his "arguements" were shot down a while back, but he's been a little slow on the uptake and won't admit it to himself.

I'm sure you meant a directory tree, though really RadioMirror can send individual files from all over the hard-drive if necessary. Putting all the info in one directory is just a convenience for whoever is updating and maintaing the stuff, it seems to me, though I suppose there are situations where the ability to send entire directories, their subdirectories, and all files contained within them could end up being useful.

About narrowness of focus, it seems like a tossup to me. APRS does two things and RadioMirror only does one, but the one thing RadioMirror does is less specialized, more versatile. The two programs use a similar protocol to distribute data, primarily differing by the kind of data they are designed to distribute.

I'd hate to have to try to use APRS to send disk files, or RadioMirror to distribute positional data!

My recently published proposal for using Radiomirror focuses on emergency communications... I have a few other ideas in mind, but haven't thought any of them through enough to write up an article except the basic idea of using RadioMirror on HF, years ago.

At one time, I was probably the only ham who had ever transmitted multicast protocol on HF, but of course since then there has been lots of APRS activity on HF, shooting me down on that count most definitively! It may seem that I would feel bad about that, but not really. I'm tickled pink that APRS has become as popular as it has, and will resume my experiments with RadioMirror on HF as soon as I can afford the equipment I need to do so. (A honking big HF Amplifier so I can put out 100 watts, full duty cycle.) My early experiments on HF were at 15-20 watts, so I wouldn't fry my 100 watt HF rig.

APRS gave me one hint for an application, being set up to continuously update a web page. RadioMirror can, in conjunctionn with an FTP program, do something similar with a great variety of data. The possibilities there are so widespread that it's hard to pick out an individual tree from the forest.

Another thing I am kicking around is to network RadioMirror servers, updating each other so as to cover a much wider area. You could get the same effect with a single HF server, but at a really low baud rate. On VHF/UHF, RadioMirror is usable up 19.2 kb. I only recommend 1.2kb for the emergency comms application because 1.2kb is easy to work with, and fast enough for that particular job.

There's no reason not to go faster if you've got the equipment to do so, but I have discovered that if you try to say "high-speed or nothing", a great many hams will opt for nothing. I've seen lots of ideas shot down because they required high-speed packet in order to fly. - So I generally look for things that can be handled at low/medium baud rates that hams are more likely to set up and use.

Why do hams shy away from high-speed packet? I dunno... I just know that it is so. The explanations that are generally bandied around (hams are too stupid, lazy or cheap, etc..) are not satisfactory to me because they do not fit the facts and are generally unworthy of the people they are talking about. I've met too many hams to buy the idea that large numbers of them are stupid, lazy or cheap. Some of them are, of course, but not enough to explain the general disaffection with high-speed packet that we have seen for over a decade, now.

Remember when we thought that the introduction of simple, cheap, plug 'n play 9.6kb equipment would be the end of 1.2kb packet? I think we all got fooled about that. It is a mystery. Only the "sour grapes" crowd has a ready explanation for it, and that explanation is both inaccurate and unworthy.

> Does anyone remember ARESData ?

The name sounds familiar, but I don't have any experience with it. A DOS file server?

Charles, N5PVL

> W1AW transmissions are intended for ham use only.

Interesting. I've seen many NON-Hams encouraged to make use of the code practice sessions in order to help them learn CW. Are you claiming that the ARRL does not condone people wanting to become Hams making use of their code practice sessions?

> You are encouraging
> transmission aim for the public. The intent is the requirement in the
> determination of broadcasting. Get out Part 97.

Sure, 97.3(a)(10) says "Broadcasting. Transmissions intended for reception by the general public, either direct or relayed. "

> Perhaps you will learn
> what ham radio is. You should also get a lawyer, as you clearly can
> not comprehend it.

I comprehend that 97.111(b)(5) specifically authorizes "Transmissions necessary to assisting persons learning, or improving proficiency in, the international Morse code," so W1AW is legal (which I'm sure they'll be pleased to hear, after you scared them so).

97.111(b)(6) specifically authorizes "Transmissions necessary to disseminate information bulletins," which may be applicable here.

So if W1AW code practice transmissions, which are clearly "intended" for public reception, are legal, it would appear that "information bulletins" intended for public reception would be also.

I am glad that you have decided that I feel "threatened." I think it
is more accurate to say that I am worried about ham radio and you are
ending the fun for everyone. You are not. You are a windbag that
keeps on going. I love about how I am another troll. Nor am I a
particularly stupid one. You can't even read part 97.

Yes, I agree that the thread is getting tired. William stands alone in the group with his "opinion", and has demonstrated that fact and logic have no effect upon him. It is probably best to ignore him from this point on, he doesn't really deserve the respect required to reply to his repetitious ranting.

I believe that there is still much to discuss about RadioMirror, but that can wait for another time, after William has had an opportunity to drift off and Troll some other discussion.

In the meantime, for those who are interested in RadioMirror, there is a RadioMirror support forum at:
http://www.uspacket.net where the discussion leans more toward technical and practical issues.

Charles, N5PVL

Well, if at first you don't succeed� I have been trying to get an APRS station up and running for a little over 1 � years now without success. The equipment consists of a Kantronics KPC 3 +, a Yaesu FT-50RD, a Radio Shack HTX-202, Diamond omni antenna at 25 feet and various computers. I registered a copy of WinAPRS and am running that on a 1.2 GHz, Windows 98 SE, 40 Gig HD, 256 Megs RAM machine. Everything runs fine except nobody can decode my packets. The red transmit light comes on, the HT sends out a packet (I can monitor that on a different HT) but all it amounts to is a burp of noise. The only way I can know for sure what the problem might be is to observe my signal on a spectrum analyzer or to check the deviation with a deviation meter (both are specialized types of test equipment that not even the Tennessee Technology Center has ever had access to).

I am left with trying hundreds of different settings on the KPC-3+ as a kind of "shot in the dark" approach to hitting the right combination. So far, in going on 2 years now, I haven't accidentally

hit the right settings.
When I listen to packets coming in on 144.390, I notice that mine sounds different, but without being able to see the signal, there's not much any way to determine what is out of adjustment. The same situation exists with both the Yaesu Ft-50 RD and the HTX-202. The TNC was successfully operated with a Kenwood 261A mobile at last year's field day, but the HTs have not worked for the most part. Two days ago, one fellow acknowledged one of my packet messages, but he was one of 3 people who have ever been able to see my station on their display. Try as I might, it didn't happen again. (Must have been a fluke) I'm not quite ready to buy a $12,000 piece of test equipment to set the configuration on the TNC, so I guess I'll just play around with it from time to time when there is nothing else to do. HI HI. I would advise anyone considering APRS not to invest heavily in it unless there is someone around locally with some nice test gear to get it properly adjusted unless you are content to just listen and observe the activity that is going on. 73, Justin

Should be good.

> Everything runs fine except nobody can decode my packets. The red
> transmit light comes on, the HT sends out a packet (I can monitor that

Start with very weak noise, and then increase the deviation at the
TNC until there is the same level as a packet you can decode.

> The only way I can know for sure what the problem might be is
> to observe my signal on a spectrum analyzer or to check the deviation
> with a deviation meter

FAR circuits sells a circuit board that you can populate and hook up
to a radio shack 15 volt meter and the discriminator output of a scanner
for a cheap $20 FM deviation meter.

>   I am left with trying hundreds of different settings on the KPC-3+
> as a kind of "shot in the dark" approach to hitting the right

Make sure your TNC txdelay is on the order of 40 ms. If you have
no txdelay, then most systems have trouble decoding. Also make
sure it's not too long (35 to 40 milliseconds is perfect).

> When I listen to packets coming in on 144.390, I notice that mine
> sounds different

Make yours sound the same loudness and purity. If you can't,
try another radio (not a handheld).

> I would advise anyone considering APRS not to invest heavily in it

I would recommend that newcomers NOT use WinAPRS, as it is
very very expensive. Try something like UI-View-32 and save the
big money for your funeral.

I concur that this may be the problem, but 40ms is way too short.  400ms should
be long enough for every radio.

(Did Mr. Cranston forget that "txdelay 40" means 400ms, not 40ms?  Remember
that most TNC's have this in steps of 10ms.)

Our friend K participates in the newsgroup without name or call sign.
Tis one of the beauties of the Internet.

But it does then make understanding a communications service that prides
itself in being recognized - a bit difficult to understand

Terry

>sure it's not too long (35 to 40 milliseconds is perfect).

I would guess that most of the rigs I have used over the years I have
been active on packet would not transmit a decodable frame with a TX
delay of 40 msec. Given that we're talking about an HT, I would have
thought that 400 msec was a better starting point.

Good day to all!

Looking for some Ramsey WEFAX weather satellite reception equipment. I'm not sure all what came with the orignal package when it was bought new from Ramsey, but as far as I remember I should be looking for the weather receiver and the PC card.

if anything, links to where I could build my own 136-138MHz 45KHz wide-bandwidth receiver would also be good.

Appreciate it!

~Benajmin

Ya know, I almost hate to do this, but I can't resist. Those considering paying for a manual in already-admitted questionable condition should first take a very close look at this link.

http://www.kantronics.com/downloads.htm

Scroll down a bit, and you'll find links for the manuals for all the standard Kantronics VHF/UHF products, in .PDF format, freely available to download.

>UI-View-32 and save the >big money for your funeral.

None of the APRS programs cost anything to download and use. The only expense related to software is for registration, if you want to be able to save your settings for next time you run the program. I used WinAPRS for about 1 1/2 years before I registered it.

Have you been able to decode other people's packets? Do you see other stations on the map? Another thing that can have an effect on other people seeing your packets relates to what kind of path you are using, although WinAPRS has a default path it uses.

I don't know what part of the country you're in because you didn't include a callsign in your message, otherwise I might be able to refer you to an APRS group in your area for someone that could help. In the meantime, check the pages at www.nwaprs.org. There are some recommended tnc & program settings there for home and mobile stations.

Sounds like you are over-deviating your signal. Turn the audio down on the KPC.

Second, I concur, get UI-View, better program, better support and only $15 (US).

Justin Time wrote:

> Well, if at first you don't succeed� I have been trying to get an APRS station up and running for a little over 1 � years now without success. The equipment consists of a Kantronics KPC 3 +, a Yaesu FT-50RD, a Radio Shack HTX-202, Diamond omni antenna at 25 feet and various computers. I registered a copy of WinAPRS and am running that on a 1.2 GHz, Windows 98 SE, 40 Gig HD, 256 Megs RAM machine. Everything runs fine except nobody can decode my packets. The red transmit light comes on, the HT sends out a packet (I can monitor that on a different HT) but all it amounts to is a burp of noise. The only way I can know for sure what the problem might be is to observe my signal on a spectrum analyzer or to check the deviation with a deviation meter (both are specialized types of test equipment that not even the Tennessee Technology Center has ever had access to).
>
> I am left with trying hundreds of different settings on the KPC-3+ as a kind of "shot in the dark" approach to hitting the right combination. So far, in going on 2 years now, I haven't accidentally hit the right settings.

All this talk about APRS has had its effect on me. Yesterday at the club hamfest, a ham there had an APRS setup for sale, and it ended up going home with me. I have monitored the local APRS digis in the past, but now I have a dedicated setup so I can do it full time.

MFJ 1270c, Pyramid 7 amp power supply, Regency HR-28 w/proper cyrstals, 120
MHz Hyperbook laptop w/Win95 and TFT video, all for 80 bucks.

There is enough information in recent posts here to get UIVIEW set up
properly. Right now I'm just monitoring the packets with Hyperterminal.

The only problem with that link, is there are no KPC-3 manuals
listed. There's a KPC-3+, which a completely different animal :-)

No. It is not opinion but fact. Everyone on the list knows it. Several
quotes from the regulations have been cited. You still refuse to quit.
Broadcasting to the public is illegal. I will be around all the time.
I can guarantee it. I didn't see you in the logs for the special event
station that I was at yesterday. I was checking the logs while operating.
Perhaps you should try amateur radio instead of your broadcasting.

"Jesse" <jessedelapaz@ilovejesus.net> wrote

> Which ham radio is ideal for packet radio? ive never heard of this till now, sounds great. can surf the net through packet radio??

Everyone I know went out and bought a Yaesu 1500 2 meter rig. These have a nifty DIN plug on the back for 1200 and 9600 baud (direct FM) and work well. They do get hot though, as the heat sink is the case. I have to hold mine, like a dead squirrel, by the power cable when I take it out of the truck.

We have a secret 9600 baud frequency we've run for years, and basically modified the scrambler PN code off the normal value. No one has ever found it yet. Basically you won't have any fun surfing the net with packet radio though. Most web sites have advanced multimedia, or no one even stops by anymore. The naked girl sites I go to, are all megabytes in size (and look better than any of the damned women I've hooked-up with in real-life), or the CD download sites, etc.

There's not many HTML-only sites left, unless you are a party to the unwashed...

As soon as TAPR gets a few dollars in the bank, maybe they will sell us some vocoder boards with the surface-mount chips already soldered on (us advanced and blind old people need all the help we can get), and then we can mix APRS and voice through the 9600 baud digital repeater.

Alan

Jesse wrote:
> Which ham radio is ideal for packet radio?

For 1200 baud, just about any radio. If you intend to sit on one particular frequency such as a DX cluster, APRS, or another local channel, than an old rockbound set can be good.

The major thing is that if you have a dedicated packet station, it could be interfered with or cause interference with your other radios on the same frequency.

> ive never heard of this till now, sounds great.

At my previous QTH, packet radio worked well until phone modems for 33Kb became cheap, then activity went down hill.

The good side of this is that you can put together a dedicated 2M 1200 baud packet station cheap. For APRS mobile, a GPS can be the major expense.

9600 baud requires either a radio designed to handle it, or you must modify the radio. The modifications do not look difficult, but I have not tried them.

I understand that you can also run 1200 baud packet on 10M, and 300 Baud on lower frequencies, but AMTOR and other digital modes seem more popular.

For VHF and higher with digital modes, it is best that they be done as a local team effort. Otherwise, the only thing you may be able to reach is satellites and shuttles.

I did work the MIR space station a few times. :-)

There are also higher speeds that have been done in some areas.

> can surf the net through packet radio??

If you are in range of a packet to internet gateway. However many ISP aggrements prohibit setting up a gateway. 1200 baud is a bit slow.

I knew of hams that use packet radio for their e-mail gateway to the Internet at my old QTH.

At my new QTH in Milford NH, I can pick up the APRS, and DX clusters, but no bulletin boards, and the only digipeater (WNDHM1) I can pick up is at the edge of my range, and seems to be in continuous use sending out DX information.

[As I compose this, I just picked up a beacon from a closer station N1NH, so maybe I will be able to reach it with my temporary setup]

I have currently jury-rigged an indoor antenna.

I have not detected any 9600 baud activity yet in this area.

If I can find a way to reliably reach the New England FLEX-NET, then I will set up my computer to act like a BBS. The TOS of my ISP prohibit making it a gateway to the Internet though.

I am just monitoring local VHF APRS activity, Bill, so there wouldn't be any way to chat through my APRS setup. I don't transmit right now on the APRS freq, and if I wanted to chat with you on the Internet, I could always - chat with you on the Internet! - and not slow down the process by adding packet radio to one end or the other, to no particular point.

For that reason, I wouldn't use the APRS messaging system, even if I were sending out an APRS beacon. Right now I'm still learning the software, so I'm not on the air. When I do get on the air, you'll be able to see my little icon. If you want to chat over the Internet for some reason, look up my e-mail address at QRZ.

When I want to chat across the country via Ham Radio, I like psk31 best, but sometimes I play with Packet, PACTOR and RTTY. I bought an old RTTY controller at a hamfest last weekend, just to fool around with. The soundcard stuff for RTTY is great, but I like playing around with specialized ham gear too. Ham Radio is a great hobby. Lots of fun.

Charles, N5PVL

Hi!

There is a new realtime psk31 monitor available at
http://www.hamradio-portal.com/psk !

Watch propagation or your own signal on 20m at 14.070 Mhz !

Please use on the JAVA Applet below the RED color checkbox to get a zoom to

14.070 and don�t mind about the right scale ! If you use the red checkbox
you�re defently

on 14.070 Mhz.

This monitoring is available 24h every day...ocator is JO31SQ / Germany

Have fun !

Andre

Absolutely incorrect. The FCC rules specifically allow broadcasting of certain types of transmissions. The ARRL makes use of this provision when it broadcasts code practice sessions and information bulletins. This has previously been pointed out to you, but you have ignored it, apparently because the facts don't support your world view (or your troll, as the case may be).

The relevent section, 97.113(b), reads "An amateur station shall not engage in any form of broadcasting, nor may an amateur station transmit one-way communications EXCEPT AS SPECIFICALLY PROVIDED IN THESE RULES" (emphasis added).

97.111(b) states: "(b) In addition to one-way transmissions specifically authorized elsewhere in this Part, an amateur station may transmit the following types of one-way communications...Transmissions necessary to assisting persons learning, or improving proficiency in, the international Morse code;... Transmissions necessary to disseminate information bulletins..."

Hi, I bought a used MFJ-1278B. Does anyone know of any free or low cost shareware programs I can use for primariy AMTOR? I know about soundcard software and have lots. I am only looking for MFJ-1278 TNC software. I dont wanna use Multicomm as I have a ham and MARS call and understand once you put your callsign on it you can't use the other easily.

Any suggestions???

Thanks

Richard W4MCD

Have a look at the packet radio section on our club website at www.TEARA.org . Click on [Packet Radio], from the main menu. We've dedicated a whole section to APRS, DXCluster, Packet BBS, SEDAN, and NOS.

> NOS or WAMPES, using the HDLC driver in Solaris (see man zsh).

In reply to the same article by Marco, Gary Coffman alwo replied:

> If you have a Sparc, and are prepared to write software, you don't need a TNC.
> A TNC is a modem plus PAD plus serial terminal driver. The Sparc can do the
> PAD (Packet Assembly Disassembly) function, can handle all protocol issues,
> and you don't want to waste it as a mere terminal emulator anyway. So all you
> need is a modem. That can be as simple as a single chip or as sophisticated
> as the WA4DSY 56kb RF modem.
>
> (Note, there's now a version of Linux for the Sparc. That has packet drivers
> already built in. If you don't want to give up Solaris, you can at least use the
> Linux code as a template for the driver you write for Solaris.)

Solaris actually has a driver (in the form of a streams module) to do HDLC, with the checksum insertion and checking. Given that nice start, I got out the text editor, and started to write some code.

I quickly discovered that solaris seems pretty brain-dead about how to deal with clock sources. They only allow the digital phase locked loop source for the TRANSMIT clock, and then only if the receive clock is from an external signal (not the baud rate generator).

Try "syncinit zsh1 speed=1200 nrzi=yes txc=baud rxc=pll" to see the error.

Of course, for packet, using the baud rate generator for transmit and the phase locked loop for receive is the useful configuration.

Given that it is now 5 and 1/2 years later, has anyone written any solaris code to actually make this work in some way? Has anyone other than me tried?

Alan

I have started to use a 166 MHz PC with cheap soundcard for some DSP, filtering, etc. I want to be able to switch input sources, either scanner or HF rig.   Looking for suggestions on what kind of switch will handle this, and will do it cleanly to avoid damage to the soundcard. I have tried toggle power switches, with bad results.

Is this the shot in the arm we need to boost activity on 2.4 GHz?

ARRL put up a web page at   http://www.arrl.org/hsmm/ to highlite a survey done by the ARRL Technology Task Force.

Using cheap commercial off the shelf wireless WiLan technology, amateurs could take back IEEE 802.11b channel 6 using modified and optimised firmware for operation under Part 97.

The 44 net could see a lot of new activity!

Let the debates begin......

I doubt that there is much choice in the radios listed, I have had a
radio shack htx---212 in my van for some time and no problems except
cannot remember how to program frequencies and have to resort to the
book but it always worked even in the cold.
Could you tell me how to post a for sale item on the web site. I have a
1278 tnc with pactor mailbox memory expansion called mfj a/b/c   and
it is another board that fits on top of the motherboard.. I have not
used it fore some time and maybe someone could make use of it as I never
will.
Thank You.

For them to claim to take the lead on this is what I object to.

There are already plenty of wireless lan groups which have amateur radio
operators among their ranks:

Seattle Wireless (Washington State)
Sydney Wireless (Australia)

In Los Angeles, the head of the "Los Angeles Wireless Users Group" is a licensed amateur.

In my own endeavours, I personally have a wireless lan card with an outdoor antenna and mast mounted amp (bringing me up to the maximum part 15 limit on power) attached to the same computer as my TNC's - but I'm still waiting for a friend on an opposing hilltop across the basin that is between us to set up his side (he has acquired the equipment - just hasn't put it together). We're 35km from each other. While waiting for him, my system has already been pinged by a wardriver or two and/or I have successfully connected to other WLANs (e.g. LAX airport, which is in our direct line - within the -3dB point of our directional antennas' primary lobe.)

For now, I choose to stay within part 15 (although barely) limits so that I don't have the content restrictions or ID requirements of part 97. It also allows anyone to connect, licensed or not.

Howdy, Dana!

I saw one thing I hadn't seen before:

"The HSMM may consider asking the FCC for a STA to allow operation of up to 10 watts output with no automatic power control (APC). "

Sounds like a good idea. The amplifiers, they say, are expensive and the one they want is not available with APC.

Otherwise though...

Am I supposed to be excited? Remember, TAPR is deeply involved in the project. Historically, that has been the "kiss of death" for the projects associated with them for over 15 years now. The "yuppity yups" in TAPR will scramble to get as much recognition for the deal as they can right now, because they know what will be happening later.

They will mightily blow the smoke screen, as usual. When it eventually doesn't fly the way they envision now, they will blame it all on those stupid, lazy, cheap ham radio operators. They always come down to that in the end; Running down their fellow hams.

Did you read the editorial in CQ magazine this month, by the way? The guy was running down hams, as much as accusing them of being luddites because they don't already all use digital voice stuff instead of SSB. Never mind that there are only two VHF digital voice rigs available, and they are incompatable and can't talk to each other because there isn't even a standard system at this point. We will have to wait out another protocol war for that, I suppose. Meanwhile the jerk at CQ had the nerve to act disgusted about those stupid, luddite hams. People like that can kiss my hiney, Dana. We don't need that kind of noise in the amateur radio community from CQ magazine, TAPR, or anybody else. It's contrary to the spirit of the hobby, and does nothing to bring it forward.

I hope that having the ARRL involved will lend some stability to the project, but instead I imagine the ARRL will let TAPR run the show, and TAPR does not have a track record that instills confidence.

I do too, but for a different reason. My objection is that they are very likely to drop the ball. They always do.

You are right though, about the publicity hunger. TAPR is desperate to appear relevant right now. They'll take whatever credit they can, wherever they can. I wouldn't be surprised to hear then pull an Al Gore, claiming credit for the work of others.

Charles, N5PVL

Not that I'm aware of.  At that time I was probably running sunos,
although I could have already switched to OpenBSD.

My solution at the time was to pick up a cheap TNC and put it in kiss
mode, talking to the tnc over a standard serial port.   AX.25 wasn't
that difficult to decode, especially since I was mainly interested
in APRS.

I've had a few Solaris boxes over the years; for the longest time I had a Solaris x86 box, but the last year or two have been using an old Ultra 1/170.

I haven't played with it in ages, but I built a streams-driver for AX.25 IP; you'd open a serial port, push a KISS-module onto it, then push the ax25 multiplexor. After that I'd ifconfig up the interface with standard tools. The only things that didn't work well were:

1) Snoop. It couldn't handle that it wasn't getting ethernet frames, but the mode worked.

2) ARP. The arp module retry time-out is short (500mS) and not configurable, so the system would flood the channel with a stream of ARP requests until the other guy got a word in edgewise.

The only real tricks were:

1) Encoding the AX25 address as 6-byte 'Ethernet'-like addresses for the sake of ARP.

2) Re-writing the Ethernet ARP frames to-and-from AX25 ARP frames.

I was briefly tempted to see if I could write a module to push
onto the HDLC port on a SPARC, but ran into the same issues and
lost interest.

Hi,

I have been watching with interest the WiFi City Networking efforts in
Seattle and other places.
I have lots of questions that I don't see any answers yet.
What will make my AP operating under Part 97 different than the Part
15 Guy down the street?

Are we going to have to modify the WiFi protocol to keep Joe WebSurfer
off my Ham Radio or do I simply LOCK the MAC addresses of the other
Hams into my AP?

Example:
Since I have a couple of 8dB antennas and mast head amp's and want
want to play Ham HSMM, under Part 97
How should I ID?   SSID = n5hyh.ampr.org ?
What about IP Numbers, should I use my Old TCP/IP Number?
Would this be the Right Net 44.76.2.76/24 ? (n5hyh.ampr.org)

See I want to play but I don't know the Rules?

Ron

More power, More interference to Part-15 users, less legal content.
Putting everyone on the same channel is stupid.

> Are we going to have to modify the WiFi protocol to keep Joe WebSurfer
> off my Ham Radio or do I simply LOCK the MAC addresses of the other
> Hams into my AP?

Depending on users to lock out non-hams would be a losing battle,
you would have to change the protocol, or use an encryption layer
other than WEP.

> Since I have a couple of 8dB antennas and mast head amp's and want
> want to play Ham HSMM, under Part 97

Can't do it, amps producing over 1 Watt ERP have to have power control.
ARRL digital team dreamed this up, and the FCC rubber stamped it.

> How should I ID?   SSID = n5hyh.ampr.org ?

Since everyone in the network must have the same SSID, that wouldn't
work. Current ID rules would apply (morse, voice, or specified data code).

> What about IP Numbers, should I use my Old TCP/IP Number?
> Would this be the Right Net 44.76.2.76/24 ? (n5hyh.ampr.org)

You could. Use whatever you want (10 net, 192.168 net, 172 Net, etc)
Only the router nodes need to be coordinated.

> See I want to play but I don't know the Rules?

It's been 2 years since the ARRL started the proposal, so there are still
at least 8 more years to go before they finally issue a report.

Hi:

I am trying to setup Jnos to work with my PK-900 and I am having mega problems. My original setup had a PK-232MBX in which every thing worked fine but can't get it to work with a PK-900. Has anyone experienced this problem or better yet does anyone have a Autoexec.Nos that they can share with me. Tnx.

Are you still smoking crack charley, don't know you, don't want to.
I'm sure this response was some attempt at loser door knob satire, my post was directed towards some one we both know, whom you were tearing to pieces.
It got sent to the news groups by accident.
please take your lithium.
Now fuck off and go away

I don't know (other than exceeding part 15's power limits).

>Are we going to have to modify the WiFi protocol to keep Joe WebSurfer
>off my Ham Radio or do I simply LOCK the MAC addresses of the other
>Hams into my AP?

I haven't encountered that problem yet. WEP, with a "public key" of "ampr.org" might be helpful. I have compiled my Linux kernel (since that's the OS the WLAN card is on) with IPTables filter on MAC address, but since my friend isn't on the air yet, when unattended, I keep the wlan0 interface down. However, note that since I'm not exceeding the part 15 limits, part 97 does NOT exclusively apply to my station, and that means that my system can talk with "Joe WebSurfer's" or "Joe Wardriver's". One of my considerations is to deny WLAN connections the right to forward over my in-house ethernet to my other gateway - where my modem to the rest of the Internet is. MY TNC's only forward "44-net" to "44-net" anyway.

>Example:
>Since I have a couple of 8dB antennas and mast head amp's and want
>want to play Ham HSMM, under Part 97
>How should I ID?   SSID = n5hyh.ampr.org ?

Via whatever constitutes a plain-text ID over WLAN stuff. That may mean adding a packet (with WEP disabled) every 10 minutes to the stream.

>What about IP Numbers, should I use my Old TCP/IP Number?
>Would this be the Right Net 44.76.2.76/24 ? (n5hyh.ampr.org)

That is up to your local ampr.org IP coordinator. In my area, there will be a separate subnet assignment.

>See I want to play but I don't know the Rules?

No special rules.

Well no thanks to you, Perry, I was able to get some new chinese auralias last week, though they are not nearly as nice as the ones you destroyed. If you are a ham (which I doubt) you should be ashamed of bringing this matter to this newsgroup. It's already cost me much more than twenty dollars to replace those plants. You should count yourself lucky that I was able to convince my wife that your "boo-boo" was due more to lack of ability than malice. I reminded her several times that you never did represent yourself as being an experienced landscaper, and that we really should have asked for references.

Don't let the matter trouble you, Perry. It's all water under the bridge, as far as I am concerned. Just move on and try to be more careful on the next job. I'm sure you will get the hang of it in no time, and will do just fine.

I guess you know by now that if you run across something that looks like a really big and ugly weed in somebody's flowerbed, it's probably a treasured, exotic plant.

Take it easy!

Charles, N5PVL

Right; the link you sent - using a PC soundcard for packet - has nothing to do with a SPARC, which isn't a PC and doesn't have a PC soundcard and doesn't have PC slots and doesn't have an Intel CPU (it has a SPARC CPU, Sun's own RISC architecture) and doesn't run Windows or DOS (it runs Solaris, Sun's flavor of System V Unix). It simply does not apply.

There's a slight chance someone might be interested in porting a Linux sound-card package onto Solaris x86, which does run on some standard PC hardware, but that's not what's being discussed here. We were dicussing the work it would take to make use of the serial port provided

```
in a standard SPARC workstation for packet (HDLC).

Oops! I'm wrong! This link does point at a soundcard
driver ported to Solaris SPARC and running on /dev/audio.
Of course, it only provide a KISS stream, so you have
to integrate with an AX.25 stack.

Sorry about that!
Dana

There is a SPARC flavor of Linux and Tom's soundmodem software has been
ported to it (the Debian distribution, at least, also has soundmodem
software for Alpha, ARM, HPPA-RISC, IA64, M68000, MIPS, PPC and S/390
in addition to x86). I don't know what compatible sound hardware is
available for these, however.

I guess I was misunderstood in my msg.   Its a "file copier" I want,
not a bu imager. I do create images of all 3 of my laptops using
Ghost from versions 5.2 up to my current Ghost2002 (ver 7).
But to my knowledge there is no DO-IT-ALL file copier either public
domain nor commercial that will get every (I said every) file on a
harddisk and copy it to whatever media you wish to use.
The old "P-copy" of bygone years did an excellent job and I still use
it, however it does'nt maintain integrity of LFN's which is a
requisite nowadays.!

I hired Perry once to mow my yard, and when he mowed down my wife's chinese auralias I had to let him go. Ever since then, Perry has felt slighted I suppose, hence the weird, disconnected nastygrams here on the newsgroup.

Perry, if you had paid attention to your work, none of this bad feeling would have ever occurred and you would have had your twenty dollars. I think it is unreasonable of you to expect me to pay you for mowing down my wife's flowers.

Charles, N5PVL

Ok, so you're speaking of PC/Flexnet(DOS/16bit) in combination with Windows 3.1 or 9x. I do not have any real experiences with that version of PC/Flexnet. And since I do not have any DOS-based computers anymore (only Windows NT or XP and Linux) I cannot even try to get it working again. :)

I'd recommend you should get hold of a PC running at least Windows 95 (better Windows 98, newer Windows-versions do not do any harm either, but are not required) and use PC/Flexnet32. It's a real Windows-program including a GUI-configuration-tool.

Concerning the TNC: You should really try to get an (e)eprom for your TNC with the 6pack-firmware in it. The KISS-driver of PC/Flexnet is (and always was) only designed to connect two PC/Flexnet-installations on two different computers over a serial cable. The KISS-protokol is not capable of controlling the timing of transmitting in the way 6pack is. If you cannot use/get an 6pack-eprom you should use a terminal-software that can talk directly to your TNC.

If that TNC has an WA8DED-compatible Hostmode you could use WinGT or Paxon (the former also runs under Windows 3.1)

There is no @ character in a standard teletype code.

If there is a @ character on the printer at the other end, you will need to find the character it is the "upper case" or shifted function for and then type it in on the MMTTY keyboard.

The more important question is does the Jornada have a floating point processor (FPU). Someone told me the Jornada does, but I don't know for sure. I have a writeup on CE and PSK31 on my website if you're interested. I've had to answer this question so many times, I finally made a page to point people to:

http://www.netdave.com/wa0ttn/WinCE.asp

Thanks.

The Jornada uses the Intel SA-1110 prcessor. I found no help at the
Intel site. On Usenet, one person said:
"The SA-1110 does not have a floating point unit, so all fp operations
are emulated in the kernel."

If true, does this mean it would be too slow?

I have been around ham radio and communications in general for several years. One constant all these years is people fighting with one another over who is the top dawg technically.

For example, one person will ask a question, usually a very simple one at that, then a looooong thread ensues where 2 or people almost kill each other over semantics and other trivial points. The person asking the question gets so confused they give up. What is even more alarming is nothing ever get accomplished, a good example is the vast amount of Packet Radio information that never gets to the point or kept secret because someone has to puff up their ego by not dealing with those who wish to learn. A certain developing group has this statement on their web site, and they are not "Ugly" Americans either.

In the final analysis no one gets a reward for their vast amount knowledge, in fact most people could careless. Systems remain disjointed and privatized for the elite good 'ole boys who really understand!

I just wish they could write in coherent sentances without telling me how
nodes in the system they adminstrate! Man building this local packet BBS and
node has been a real trip with the group who has been "supporting me".

In article <av53g7$fqv$1@news.chatlink.com>, Do not want u to know <no.email@no.mail.org> writes

>I have been around ham radio and communications in general for several years. One constant all these years is people fighting with one another over who is the top dawg technically.
>
>For example, one person will ask a question, usually a very simple one at that, then a looooong thread ensues where 2 or people almost kill each other over semantics and other trivial points. The person asking the question gets so confused they give up.

[snip]

One thing you need to appreciate is that the relatively few hams who try and post helpful replies to packet questions tend to be "old-timers", if not in age, then in their experience of packet. So what seems to you "semantics and trivial points" might not seem the same to them.

Also, your "very simple" question might not be as simple as you think. A lack of knowledge can make the complicated appear simple. Having the (mis)fortune to be someone who provides packet software, I see these "simple" questions very often, and quite often they're so "simple" that I don't know where to start my answer. The knowledge level of those

asking the "simple" question is sometimes well below what I needed to
pass my first ham radio exam.

So, if someone asks a "simple" question, and the resulting debate goes
over their head, the best thing they can do is to say "This is going
over my head! ... <explanation as to why>"

Since the DPK-9600 is worth quite a bit more than any 1200 baud TNC, you can probably find somebody who will trade you two-for-one, or at the very least swap you even for a 1200 baud TNC that has all the documentation with it.

Worth a try!

This is exactly my case in point.

1. Do not drink nor take dope, e.g. you have no idea who I am, you project your own prejudices upon the unkown person.
2. You like to arugue symantics and wording when knowing nothing about the person or the situation.
3. Takes it personally, as if I have an idea whom he is, and his place the big picture of life, or at least through his eyes that is.

This was my first post to this group, in fact, my lamenting was to keep from telling off the arrogant know-it-all I have to deal with at a government sposored program office.

Roger,

I understand what you are saying and where you are coming from in your described situation.
Let me clarify where I am coming from; while exchanging email with an individual within a volunteer government program office, this person will send extremely long emails (the last was 4 pages long). Roughly 90% is about the number of nodes he administrates and how great he does his job.

After this preamble of minutia (which is typically 1 to 3 pages of acronyms and jargon) , he talks down to me and always conclude with the statement that he will have to "package it up and FTP it", because he assumes I am "not knowledgeable enough" to understand . Even though he posed no question were asked to ascertain what level of understanding I possess.

I have been an Electronic Technician and an Engineer for over 20 years. I have watched the
same situation pop up over and over. My questions are really these;

1.Why do they have to belittle and treat people like idiots?
2.Why do they feel knowledge kept to themselves prolongs they tenure in a job or make them indispensable?
3. Why do they stifle open discussion with statements of negativity?

Really these questions are not being asked for my edification but maybe to make these people think outside
of their own little self centered world. To make them realize some times the rest of us have no idea where they
are coming from either, and just want the facts.

Thanks for taking the time to reply, what is really needed on the USENET is a forum possibly named
"therapy.radio.amateur.for-know-it-all-syndrome" for those of us who end up being the brunt of another's
verbal abuse.

Actually I was being charitable by suggesting that you must have been inebriated when you posted.

Now you are saying that your rambling, disconnected diatribe was done while you were sober...

Victim of a head injury? Umbilical cord around your neck? Scared by good grammar as a child?

Just wondering what your problem is.

> 2. You like to arugue symantics and wording when knowing nothing about
the
> person or the situation.

Hence my curiosity as to what your problem is. Obviously you've got one.

> 3. Takes it personally, as if I have an idea whom he is, and his place the
> big picture of life, or at least through his eyes that is.

I didn't notice anybody taking your incoherent complaining personally. In fact, you can count yourself lucky that anyone bothered to reply to it at all. Usually, the obvious wackos are ignored here, except a few who are associated with TAPR. We don't ignore them because they are so funny.

> This was my first post to this group, in fact, my lamenting was to keep
from
> telling off the arrogant know-it-all I have to deal with
> at a government sposored program office.

Oh, so you dumped on an international newsgroup instead. How clever.

Screw up your courage and tell the government guy off, next time. That's what they are there for.

Charles, N5PVL

Wrong degree. You now need a minor in psychology (child), or raise three kids at the same time.

> 1.Why do they have to belittle and treat people like idiots?

A.) You are an idiot
B.) They are an idiot
C.) You are both idiots.
D.) you are unwilling to love and respect each other, ever.

> 2.Why do they feel knowledge kept to themselves prolongs they tenure in a
> job or make them indispensable?

Study Maslow. He worked years with monkeys, and developed a "heirarchy of needs." Things like: Esteem, Self Actualization, Belonging...

> 3. Why do they stifle open discussion with statements of negativity?

Negative energy is right at the surface. Positive energy comes from the heart. Close friends and family operate 60%/40% with positive energy, while people who merely communicate long distance about areas which they might profess a high degree of experience, operate 40%/60% favoring negative energy. They do not love each other, and never will.

Almost all customer service training centers will try to move a trainee to at least a 50%/50% energy ratio. Companies with major problems in this regard, have only a 10% swing to failure.

> just want the facts.

If you love (emotionally bond) with the individual, he/she will treat you as an equal (emotionally). Generally humans treat new acquaintances with all the joy of a one night stand. Each steeling the others energy and washing it off in the shower, slamming the door behind them, as they run home to the ones they really love. Sometimes negative energy becomes so great, it jumps off like lightning without control. These people spend hours in newsgroups, each shocking the other with massive jolts of negative energy. Say 10%/90% energy ratios. No detectable love essentially.

All you need is love...

```

When I worked for a major aircraft company, I talked on the phone every week with a parts lady who was probably the sweetest disposition you could imagine. She was so bright, and all her mannerisms were completely that of a woman who raised several children. Almost like a sweet grandma.

One day I found myself in her city, and I called her up to meet for lunch. We could both see each other for the first time. She told me to swing by her office, and we could ride together. She said just ask the secretary where she sits, and we can meet in her office, and then head out to lunch.

As I was walking down the hall, I heard this woman just cussing up a storm to one of her employees (I could only guess), and around the corner I came, and this androgynous woman in a pants-suit with 2 inch fingernails was using them like blades to show where the employee had completely screwed the paperwork up. She sees me coming and shoo's the employee on his way, and greets me like a lost brother (all kisses and smiles).

She said she needed a drink, and let's go to this tavern she knew had a great lunch. Where-upon she just blasted me with all the idiots she has to work with. I would interject a few rays of hope, and she would beat me down with another tirade, and after about three drinks she mellowed out enough to actually become a very nice person again, and began eating her lunch. I had the waiter snap our picture on the way out, just to show all the guys back home, who bet she weighed 300 pounds, was bare-foot, and had two babies on her knee.

Your assignment is to tell us why she has two (or are there more) personalities. This test will count either 60% or 40% of your final grade, depending on how much I like you.

Well, Why do you not update the list? How is someone going to find out if all the lists are not updated? Sounds like YOU are not doing your homework. Be courteous and helpful to other operators. Radio is a 2 way interaction. No one will play with you, if you can not behave.

I would appreciate that you don't make your malicious comments to the other fellow. Your little quote is a demonstration of your attitude. I think that you need to act in a civil manner or not act at all.

I think that we should start a campaign to have you removed from any organization such as the ARRL. Perhaps you would care for the consequences of your actions in the future.

Not intentionally meaning to defend Hank, for the western U.S. states ("6-land," "7-land," and maybe even a couple states in "0-land") until about a year ago, there were monthly updates to the "WestNet" packet BBS list. The person who maintained the list passed away. I don't know if anyone else has picked up that task. However, what this means is that there does exist a list that is about ONE year old, alot newer than the 8 year old list cited above.

The list I refer to can be had from http://www.qsl.net/scaps/ - it's in their web site somewhere.

And perhaps you should be removed for not demonstrating due dilligence in
searching for the most current list.... :-)

If you delete the whole list, throw it in the trash, it will then
be accurate.

There are no national BBS systems on packet anymore.
It's all history.

APRS is the only thing going, with 9600 bps digital voice
the up and coming new rage (old Motorola gear with
Project-25 vocoders). Once these repeaters start popping-up

everywhere, they will also be able to do 9600 APRS.

William, you can take your fascist attitude and stick it where the sun don't shine.

I don't always agree with Hank but I know who he is, and what has done for the hobby.

If you can't respect your betters, maybe it's you who should take a hike.

The TAPR list, by the way, was a joke from day one. The organization has a long history of actively discouraging both node and BBS operators in the U.S.. Part of the organization's methodology is to pretend an interest in things they wish to limit or control.

Try getting on the TAPR BBSSIG, for example, and talking about running a packet BBS using ham radio. You'll soon find yourself the target of ridicule. That's TAPR, as it has been for over a decade that I know of.

If you are not into amateur tcpip, "IP only" in fact, you get attacked by the TAPR goons.

Do your homework. Check it out. It's a bogus organization, run by militant LandLine Lids.

I can quote you a post where Steve Stroh, an officer in the organization, shows up on the BBSSIG to nastily run down the entire concept of packet bulletin boards.

Great "support", huh? Time for an attitude check, OM.

Charles, N5PVL

Hate to be the one to break it to you, bright boy, but you are 100% wrong.
There is a lot of activity, but it's a Ham Radio activity so of course you
wouldn't know anything about that.

>
> APRS is the only thing going, with 9600 bps digital voice

More horse-hockey. 9600 baud APRS has been possible all along, from the day the protocol was introduced. They use 1200 baud because it is more practical, and more hams can participate that way, not because it isn't possible due to a lack of digital voice repeaters.

When digital voice repeaters appear, the same situation will hold. The 1200 baud stuff will still be more practical, allowing more hams to participate for quite some time. In other words, don't hold your breath.

I changed my mind... Go ahead and hold your breath.

You seem to be proud of showing off your ignorance. Every time you post here, it's more of your ingrown nastiness and ignorance, talking through your hiney.

I would suggest that you "blow it out your butt", except that is what you have been doing all along.

Hi, I bought a used MJF-1278B and also the software that was purchased
for it. Does anyone know a way to remove the old callsign that
belonged to the previous owner?

I have used the MYCALL command and entered my callsign to use it for
that session only. But is there a way to have the software use my
callsign only?

Thanks and 73

Huh?
All I did was point out that the TAPR list is way out of date.
How does that make it my fault?

> I would appreciate that you don't make your malicious comments

Naw ... you just get kicked off the list if you try and move the
topic to radio instead of the internet.

Hey Chuck,

How about if I ask ask you these questions.

a. Did you get a head wound in Viet Nam or step on a landmine (or maybe a land mime)?
b. Did your old lady leave you because you have no life beyond the USENET?
c. Do you acquire Gulf War Syndrome or maybe post Nam drip?

d. Did you get shocked as kid when experimenting with a knife and AC wall socket?
e. Did Riley ask you not to talk too much on 146.520 MHz?
f. Were you asked not to chack into the Channel 19 truckers net?
g. Did you get shocked while working on your "leaniear" amp?
h. Do you Hablow Espanieese?
i. Are you engrossed in the book "Thoughts and Quotations of Chairman Mao"?
j. How many ducks does it take to make a gaggle?
k. Is "pi" really square instead of round?
l. Is there life after the internet?
m. How many ducks does it take to make a heard or how many have heard of heard of ducks?
n. If you lined all the ducks in the world in a straight line, would anyone care?
o. Is there life on Pluto and is it canine in form?
p. Does Captain Piccard wear a hair piece off the set?
q. If two ducks and two trees were hit by a drunk motorist could that person be charged with DUI and killing quakers and twees?
r. Will Elmer Fudd ever kill Bugs Bunny and have him for dinner?
s. Will the Coyote ever catch the Roadrunner, and if he does will he remember what to do with him?
t. Do you have a sense of humor?
u. Does anyone care?
v. Do ducks live Quang Duc provience?
w. Do ducks who fly upside down really quack up?

Chuck for you information that is rambling on, I have learned from you the master namely you. God it feels so good to be superior, thanks for the lesson in how to be above the rest. Thanks for making me see the light, now I can reach for the heavens.

Have a good day Comrade Chuck,
Manfred B Besser IV

PS:

Chuck I want to warn you of something, e.g. this is the last post from me, I will not read anymore posts regarding this thread and therefore have the last word as far as I am concerned. Don't waste the minute amount of storage space it will take for your dribble go screw with someone else who more appreciate your great intellectual abilities.

naw naw naw Chuckie!

>
> William, you can take your fascist attitude and stick it where the sun
> don't shine.

Fascist attitudes are demonstrated by Hank and you. I saw your post to QRZ. You want ham radio only to be ham radio on this newsgroup, but you are certainly willing to setup stations without ham operators to receive traffic.

Hank is a disrespectful and ignorant person. I think that you all missed that I just popped in this thread after your "Hank" was trashing some poor ham. I don't like the comment about doing my homework. I wasn't even involved, Mr Stussy.

As far as your comments regarding 9600... 9600 is very practical. Everyone in the world should be able to 9600 for $200 or less in brand new equipment. They can cobble up stuff for much less than store bought People like you are holding back ham radio.

You waste all your time about saying things are not ham radio. Most of your posts are against the newbies. You then post the BS on QRZ.cOM! You and Hank are not real ham operators. You would behave in a civil and supportive manner towards your fellow hams. You would encourage the growth of the hobby and not as the tool for other systems. Other systems which have better communications and no need for us other than a cheap out from doing their OWN WORK. They get paid for the stuff. They have the money to buy their equipment. They don't need us doing their work.

I want fast links. Your emergency communications is useless when I can type faster than the system. If you had a real emergency how are you going to get stuff out to people? You aren't going to be broadcasting information relevant to everyone, but lots of small traffic relevant to only certain people.

The only thing that you do is insult everything like Mr. Oredson. How is the other fellow supposed to find out anything if folks like you don't update the lists and only fault those have a list?

I hope that you realize from my ethnic background about how insulted I am. To be called a fascist is the worst thing that you can call me. It all shows how little that you understood from my post, because you read it in the entirely wrong context. I will drop out from posting again, because I can't stand your bs.

N5PVL, Part 15 802 networking over long distances is radio. At least some of the folks are doing radio even if it isn't your HAM RADIO. It is not like you know what Ham radio is anyways as you've demonstrated your broadcasting desires.

As for Mr. Oredson I am trying to find out all of the BBSs in my area. I have been slowly trying to figure it out for myself without bothering the likes of you. In the Eastern Mass section I have been able to figure out for myself that the backbone died awhile back on 1.25m. I can't find out anything right away because you guys waste some time on jockeying around and insulting the newbies. I'm still trying to figure out the lay of land. No one knows little more than their own piece of pie here. Everyone is so fragmented. Why? Jerks like you waste time about what is ham radio and tell everyone else to do this to sate your needs of ideological control of the essence of a ham radio operator. None of you actually want to build any high speed packet. None of you actually want to do something with radio. You are a disgrace to ham radio. You just talk about how there is no radio on a newsgroup. This is not the fun that I signed up for. People get treated properly in the world outside of ham radio.

The comments of Mr. Young are only a demonstration of the fragmentation of ham radio. He does not know what is out there because of people like you. Radio requires two people at a minimum. Mr. Oredson, I can see that you truly don't understand. There are a few nice people out there and they know who they are. Thank you to those people.

When folks come here all whiney, demanding, ignorant and insulting, I pretty well give them the back of my hand.

The ones who denigrate any legitimate aspect of amateur radio get the old heave-ho as well.

Hams (and non-hams) who ask polite questions or make polite statements are treated politely, yes even if I disagree with what they are saying, as long as they are not saying something detrimental to the hobby. (LandLine Lids, for example.)

Anybody here can say pretty well what they please of course.

... Including me.

Hello All,

I have uploaded TrueTTY 1.97 to the main site and mirror:

http://www.dxsoft.com/truetty.zip
http://www.hamport.com/truetty.zip

Best regards,
Sergei mailto:amx@dxsoft.com
http://www.dxsoft.com

==

TrueTTY Versions History

V1.97
The documentation was update.
Some minor improvements were made.
V1.96
TrueTTY can decode signals from a WAVE-file now.
See the "File->Decode From File" command.
A WAVE-file must be Windows PCM file, without compression.
A sample rate must be 11025, 22050 or 44100 Hz.
Preferred file parameters are mono, 16 bit, 11025 Hz.

The ExchangeSpeed parameter of the TRUETTY.INI file defines data exchange speed via additional COM-port now.

Some minor improvements were made.
V1.95
TrueTTY can exchange receiving and transmitting data to another software via additional COM-port now. So, TrueTTY can emulate hardware modem or TNC.

The "Setup->Data Exchange Interface" menu selects COM-port used for this
purpose. So, with two com ports (in single computer or in two computers)
connected via null-modem cable, you can use TrueTTY with another terminal
software intended for hardware modem using. For example, you can try to use
TrueTTY with WF1B contest software (though I prefer AALog). A speed of
data exchange via COM-port is 9600 bauds. See null-modem cable schematics
in NULL-MOD.GIF file.
If you are using COM-port for PTT interface but don't use it for FSK, you
can use the same port for data exchange also.
Software COM-port emulator can be used also. I have used VSPD virtual
COM-port driver from http://www.mks.zp.ua with success.

In AX25 mode TrueTTY can work (to receive and transmit) as KISS-TNC via
COM-port or DXSOFTEX.DLL interface now. KISS mode is switched on by
the "Setup->Data Exchange Interface->KISS Mode in AX25" menu item.

I have successfully tested TrueTTY with great AX25 software Pr4Win
(see http://www.geocities.com/nl3asd/download/pr4win.html ,
http://www.qsl.net/oe8djk/) with hardware COM-ports (USB/COM converters)
and with VSPD driver.
V1.93
The "File->Open KISS Capture File" command opens capture file to
save all receiving AX-25 packets in the KISS-format.
The program behavior at not very vast computer was improved.
Some minor bugs were fixed.
V1.92
The "File->Open Buffer in Notepad" command was made. It saves receiving
buffer in a temporary file and opens this file by a text editor. Then you
can view this file or print it. The hotkey of this command is Ctrl-N.
This command is available in registered version of the software only.
A bug with the "List index of bounds" message appearing during editing of
text to transmit was fixed, I hope.

> If true, does this mean it would be too slow?

Yes, it wouldn't be able to handle the floating point math for the DSP and FFT computations. For an example of what's going on with the calcuations, you can look at Moe Wheatley's (AE4JY) source code for version 1.2 of WinPSK on his Web site: http://www.qsl.net/ae4jy/ You'll see that the calculations are pretty hairy.

It's kind of a shame, but CE devices are intended for simple data storage and organizing, for which an FPU would be superfluous.

Hmmm... Yup, I like it...

Kinda messy, but democratic here on USENET, sorta like politics in the good old USA,
not like those nice clean "moderated" centrally controlled sites where all *discourse* is
censored and edited by the owners to suit their own agenda.

Why does ANYONE put any "faith" into TAPR at all?

First of all, they are a REGIONAL group (local to Arizona) and carry no weight or authority outside of their area. However, there have been so many posts over the years in various places (on packet as well as the Internet) where TAPR is almost elevated to the level of a "packet god." What did they ever do to deserve that?

Here in Southern California, we have NEVER listened to TAPR at all, even when we had our own packet/digital organization, the SCDCC.

You must live in a pretty strange place if your parking lots are like that.
Guess you see what you want to see ...

Hi!

I'm trying to get the Linux Soundmodem
(http://www.baycom.org/~tom/ham/soundmodem) working on Newqpsk (Q15X25)
mode. As mentioned on many Websites this should be possible.

But what's the correct initialisation?

```
sethdls -p -i sm0 mode ?????? io 0x220 irq 5 dma 1 serio 0x378
```

Where can I find a list for soundmodem's valid modes?

Are there any MBOs working with this mode? Or which frequencies are used?
14.1095 - like MT63?

Thank you very much.

73 de Andreas Weller, DF1PAW

"Tucson Amateur Packet Radio Corporation"
It's the name of a Company ... not some "regional group".
Originally headquartered in ... Tucson ... at Modular Mining.

Perhaps Lyle still lurks around the newsgroup and could
comment on the (sale? transfer?) of the name and assets.

Thus it is a good idea to avoid their web site, since pretty much
all the information there (and pretty much all the software) is
well out of date. Tried to get my old (and very obsolete) BBS
codes removed from their site some time ago. No cooperation.

.000 000 45 seconds
.000 45 msec
.45 usec

Most FAA interrogators (not TCAS equipped aircraft) operate at
5 ms PRT (pulse recurrence time), or about 200 interrogations a
second. As the antenna scans through the targets it will evoke about
100 replies from each aircraft.

What you are basically attempting to do is watch 2 MHz worth of
spectrum on a 5 kHz radio (1/400th of the spectrum), and while you
will see something, that something is completely corrupted.

Haven't checked all of the ins and outs but the twpsk package has included
an underlying psk311x that runs in CLI mode.

Hope this helps

Say I sliced up the neighbors cat into 400 equally spaced slices, and
handed you one slice. Could you identify that it was a cat, or what
the cats name was?

Meow...

For the 430 I think there was a mod required to accommodate the rapid QSK of
AMTOR arq. If memory serves, the 440 did not require this mod and should
work fine. Most guys used the mic connector. Since you cannot use narrow
filter, a Timewave DSP mod to the 232 would probably be helpful.

Sri, Don, but Indianapolis no longer has a 2m packet BBS.  I think you
either have to get up to Fort Wayne or down to Bloomington.
Best,
John/K3JZ

BBS? You're kidding right?? You are aware that this is now
the 21st Century? The only packet you will find, is APRS and
the satellites.

The Jornada is an HP handheld PDA that (I believe) runs Windows CE3. As such, it can play wav files and has some rudimentary sound capability. Someone thought there was A/D conversion in the modem that could be harnessed for sound card radio. There was some speculation that a PCMCIA sound card was just around the corner.

Has anything happened to make the Jornada an effective sound card radio PC?

That list is mostly useless now.
Appears it was last updated over 8 years ago.
For Oregon, it is almost 100% incorrect :-)

How would you know what we have in Indianapolis?

Do you forward/receive from here?
What's the 2m callsign?
What's the 2m freq?
What's the 2m baud rate?
Who's the 2m trustee?

Thanks!

How would you?

I just did a web search on 'packet radio indiana" and came up with quite a few links.

Are you saying that Indianapolis is a packet radio "black hole"?   I doubt it.

If Indianapolis really *is* a "black hole", your attitude would go far in explaining the phenomena.

Charles, N5PVL

What 2 meter freq should I tune to, to access a BBS?

Thanks!

I communicate with several hams who run nodes or BBS
systems in Indiana. Seems like you are unaware of what
is around you. Oh well, happening all over the US recently :-)

Homework assignment:

I sent you a list of callsigns.
Contact one or more of those folks, and they will tell you about activity.
Until you have done that, nobody here gonna take you seriously.
Once you have done that, report back here.

I'm new to PSK31. Just set up my rig for receive. Digipan is working. However, it does not display the frequency above the waterfall, just 1000, 2000, etc. I have display frequency checked. Is the a way to diplay the actual frequency instead of the 1000, 2000 I see?

Tks

Does Digital SSTV exist? I have done some research on the Kenwood VC-H1, but it is not digital. I would appreciate any links to websites or knowledge that anyone can share.

Thanks.

After 38 yrs of pounding the brass I thought Id like to set up one of my
stations for the digital modes both for ham and receiving commercial
stations in general coverage. PSK, Pactor, packet, amtor,etc - what are the
more popular interfaces available that you guys are using? For either my
1000D or 756pro? Ive received rtty on the pro but don't have time to build a
interface for transmitting and would rather buy one that does all the
different digital modes available today. Plug and play<g>
I know there are several companies making them now including Rigblaster,
MFJ.
any info is appreciate, please email me at: Steve
N6TT@hotmail.com

I've had good luck with the RASCAL, available at http://www.packetradio.com/
.

You can get it assembled, or save some bucks by assembling it yourself from
a kit.

That's what I did. It gave me an excuse to heat up the old soldering pen.

I second the Rascal. Kits are on sale thru 12/31 for $19.95 -- which
is less than the cost of the cables -- if you buy them at Radio
Shack. www.buxcomm.com

BTW, you won't be able to do HF synchronous (e.g., Pactor) TX with a
sound card. RX yes.

However, I did see some discussion of MixW maybe being enhanced to do
G-Tor RX and TX . . . .

Donner Digital Interfaces are a real deal - assembled for only $40. The top "5" rating from reviewers on eHam. I have bought three of them and everyone worked without a hitch. Simple, easy and they work.

http://home.att.net/%7En8st/

BTW, I have no interest the the Donner company at all.

Steve,

I found an AEA pk-232mbx on ebay to be just about the most cost efficient if you want to do the "tor" modes for traffic handling type activity. Timewave, who bought out AEA, carries upgrades for the pk232mbx to just about any level you need if you happen to get an older model.

Some of the older Kantronic units would be ok but I just haven't been able to ascertain whether or not upgrades can be obtained. Until I can confirm a purchase path for upgrades I am being rather leery of these units - unless an extremely good price happens by.

If you don't want the "tor" modes; amtor, pactor, or g-tor; a sound card interface to a computer is by far the cheapest way to go, at least if you have a computer that doesn't generate so much noise it covers up the

signals. A *good" atx case with a generic AMD or Pentium motherbaord will
usually be ok.

Will this indicate that there might be software for RTTY/SSTV as well
for Linux ?

I previously posted this under Jornada and PSK31.

Are there any sound card programs that run under Windows CE?

It appears that there is now at least one Windows CE3 machine -- the HP Jornada -- that takes a PCMCIA sound card. I believe this would be the first PDA (more like a mini-laptop) potentially suitable for PSK31.

Not having diddled with Windows CE, I do not know if it even has any hooks that will let it access a sound card. Anyone know anything about this?

Do any other PDA's take a PCMCIA card?

Does anyone know a file copier that will copy every file
on a hard disk including those with hidden attributes etc?
I was told that no such file copier exists that can get everything,
even if it works in DOS.   I was also told XXCOPY could do it
using the /clone switch, but in attempting that, the /span
function didnt work so could not span thru CD-r's.   Is any
complete file copier in existence????

```

Hi all

Have a strange problem that I wont give all the config/details on unless someone requests them!

I occasionally run soundmodem 0.7 and Linpac 0.16 and have noticed one or two problems. (Note that this is not the kernel soundmodem driver)

- I cant get serial port PTT to work properly. (It works fine for other programs like twpsk, qsstv etc) If I run soundmodemconfig the PTT asserts as soon as I open any of the diagnostic boxes. Toggling the PTT button in the diagnostic box doesnt unkey the radio. I have succesfully setup ppdev/parport keying but it would be nice to run it only from the serial port. Does anyone have it working on a serial port

- I have noticed that in normal AX25 connect mode my TX will occasionally flatten the station I am receiving almost as if it is ignoring DCD. How much time does the soundmodem driver need to recognize an incoming signal? (1/2 a second of received signal would be the worst case) I seem to remember that the driver can also use the squelch function of the radio but cant remember where I saw that statement. FR I am running the soundcard (SB16) in HDX as well as the radio I/F. Any thoughts or references I can lookup?

- When sending a file using YAPP over (say) 10Kb and under (say) 80Kb to a WinPac equipped station the file transfers okay, but at the end I see a string of aborts by peer. More than 80Kb results in the same abort, a complete failure and a retry recovery corrupts the received file. It is interesting to note that the LinPac send window "sends" the entire file quite quickly as if a large buffer is being filled up. I would guess that there is some kind of YAPP timeout coming into play as the pgm then sits there and waits for the success packets from the peer. Anyone have this problem?

- I run ulistd and the axgetmail utilities in concert with my local BBS. This works well. Linpac docs kind of infer that 7+ messages will be "automatically" saved to the combined file on receipt but this doesnt seem to work with axgetmail/ulistd or selecting download from the LinPac mail interface. I *think* it works in interactive connect mode but I haven't checked thoroughly. Is anyone successfully using this? Any thoughts on my system's failure?

Cheers Bob VK2YQA

You can clone your hard-drive to another using Norton's Ghost.

Bucketloads!

Try QSSTV and GMFSK (does Mary FSK as well as RTTY)

I personally use QSSTV in my bi-weekly skeds on 2M. The quailty of P7 is something to see! I've only just started with GMFSK but so far it looks good. I compiled both from source.

Also have a look at http://www.qsl.net/kf8gr/software.html

Cheers Bob VK2YQA

Joe,

Take a look at Norton Ghost. I keep back ups of my hard drives on CD's. Became a beliver when one died. Installed new HD and ran the restore function for that drive, presto, everything back to the date of the back up.

Ghost gets everything, boot sector etc.

For bringing up the drive your operating system is on they have provisions in the software so you can restore a new drive provided your mother board can be configured to boot from a CD.

The disadvantage is that the Norton Ghost files are compressed and not accessable for individual files.

Hope this helps.

Bob

Could it perhaps be your constant personal attacks against anyone who
disagrees with your opinion on the future of digital ham radio.

Hi

Ken wrote:

> The TxDelay=20 seems to have fixed it all. I was guessing 1-3.

Ah, ok, normal PLL-Transceivers need about 200ms to switch. Some only 150ms, some even 250ms. In Germany we usually use a TNC-software calles simply "The Firmware" which has a parameter for TxDelay, which is set in steps of 10ms. Most other softwares emulate this behaviour. So setting the TxDelay to 20 sets the actual time-delay to 200ms.

You might want to try to reduce that setting to the lowest value that still works.

> And I all of a sudden started speaking German.

I noticed. :)

73 and much fun with PC/Flexnet + Paxon.

Psk is usually setup for USB, not LSB. I don't think it really makes any
differance which sideband is used, but the radio room is under construction
now and I can not verify this. For some of the other digital modes suchas
rtty then the sideband and normal or inverted modes do mater.

Thanks for all the tips! I tried WinPSKse and it works fine! Must be a
Digipan setting somewhere that gave me the hassle.
20M is in much better shape than 12 hours ago, too.

Here a handy link to spot band openings:

http://hamcall.net/dxspots

Thanks to all,
Gary

I'm trying to use the latest version off the website.
With ui-view 32 but I get an illegal operation when I try to send a Query or
ping etc via ui-view...

Any ideas?

That doesn't answer my question about hardware -

>"Roger Barker" <roger@peaksys.co.uk> wrote in message
>> So you really need to explain what specific problem you are having, what
>> hardware you are trying to use - sound card, TNC, etc - and what version

But I'll guess you are trying to use a sound card modem

Here's some general advice - Put UI-View away, get yourself a copy of
AGWTerm, and get your AGWPE working *properly* with it. That way all
your software comes from the same author, and you won't be confused
about which program is causing your problem.

When your AGWPE will work with AGWTerm, so you can make connections, and
send and receive frames without it crashing, then get UI-View out again,
and you should find that it works fine.

I forgot this bit - for an excellent guide to AGWPE with a sound card,
go to KC2RLM's web site - http://www.qsl.net/soundcardpacket/

(But at the moment I think www.qsl.net is down...)

Myself and another Ham (SK) tried connecting through a repeater using packet on purpose back in the 80's. It didn't work of course, because the repeater audio is not only delayed, but highly filtered. Sounded good, but no decode. You would have thought a nuclear bomb went off, because suddenly everyone in Oklahoma City was trying to find out who it was. I think we boosted activity on the repeater for a week, while everyone had a roundtable on proper repeater operations. I won't say which repeater it was, but none of them have ever owned a piece of ham gear that wasn't clipped to their belt, and nerd would be an understatement :-)

Without making comparisons, it is very very easy to work DX using PSK31. If you can hear them you can work them, and frequently you will. One thing that makes it easier is that unlike SSB and CW, most of the PSK31 stations seem to be relatively modest. The big guns are all up on CW or SSB. My $.02

Article "Emergency Digital Communications - Another Angle" at:

http://www.uspacket.net/l_ecom01.htm

Describes a proposal for using multicast broadcast protocol for some
emergency ham radio communications tasks.

Software links, setup suggestions included. Read about it, then do it!

Make sure output from sound card is "selected" and NOT muted then tune rx to
14.070mhz. --or 21.070mhz ----28.120mhz
rx must be switced toUSB.   iF ALL CONNECTIONS ARE OK ---you should now see
vertical traces running down from the "waterfall" display.make sure you
select "trace"colours which show in agood contrast to the waterfall
background. these frequencies are the most likely ones to rx psk
transmissions 73 de gm0ltq.

At last...

1) Tosh 2805 laptop with the funky Yamaha sound chip YMF754

2) Mandrake Linux 9.0 - 2.4.18, alsa sound driver worked well with above
mentioned YMF754

3) KPSK 1.0

First QSO (about 20 watts) on 20 meters yesterday with special call 6J1YJS,
FEDERACION MEXICANA DE RADIO EXPERIMENTADORES, A.C. LXX ANNIVERSARY. Thanks

Joaquin!

Unfortunately it seems i have used much to high level of audio in to
this transceiver, spec says 10mV i used apx 5Vpp over many occations...

Since i now can not see any "life" in my ALC/PWR-meter, something must
be wrong ??
It stood on around 8watt when transmitting, now obviously no more than
zero...

shit.

Any help/ideas ?

Torbjorn.

Hi, I'm working on a little project trying to decode transponder
replies
from my pro-2004 receiver.. They are little blips on 1090mhz,
supposedly the
format is 2 framing pulses at 20.4 microsecs apart, with 12 pulses
in between at about .4 microsec each... When I view these sounds

visually with
a sound editor I can decode them manually- how difficult will this be
as a beginning dsp project? Im a seasonsed programmer, just no
realtime experience or sound whatsoever... Would I be better off with
the baseband audio/discriminator output from my receiver?

Does anyone know of an api or framework I can use to get started? I
was hoping to find some C program that did tacan or CW decoding or
something and I could hack it for this purpose. any help at all would
be greaty appreciated.

Don't know about decoding it with a sound card, but for what the codes really are, how they're timed, and what they mean, see http://www.airsport-corp.com/modec.htm

You are aware that random replies are going to contain both mode A and mode C data I presume?

Then there's the little problem of civilian transponders vs military IFF.

For a discussion on that, see http://www.dean-boys.com/extras/iff/iffqa.html

And of course, there's the up and coming mode S replies. I'm afraid I don't have a link that explains that encoding.

Are you sure you can do this? Those timings imply a pretty broad
bandwidth, well beyond what a typical scanner and sound card can handle.

Phil

Hello All!

  Have here a Kantronics KPC3 Plus manaul upfor grabs.

Good Condition for the exception of some kind of stain on bottom
right side.. about the size of a 50cent piece.

Just asking $5 and whatever it costs to get it shipped to the
address your provide.

Email me with your interest and we'll go from there.

Respectfully,
~Benjamin

What sound editor are you using?

> Im a seasonsed programmer, just no realtime experience or sound whatsoever... Would I be better off with the baseband audio/discriminator output from my receiver?

Poor choice of radio. The pulses are .45 usec and you need about 2.5 MHz bandwidth to pass them without distortion, and a log-amp to get the dynamic range of replies.

Also, you will need a second receiver to gate (enable) the first when the interrogator (airline or ground site) is transmitting the mode, otherwise all the codes received are giberish, as you don't know if they are mode 1, 2, 3, or C.

> Does anyone know of an api or framework I can use to get started? I was hoping to find some C program that did tacan or CW decoding or something and I could hack it for this purpose. any help at all would be greaty appreciated.

This is best called "the fringe" as far as experimenting is concerned :-) The question you want to answer, is what will you do with the data after you decode it? Theoretically you will have a gadget that outputs 1 of 4096 codes at any point. Now what?

Keep an eye on eBay. Lots of old transponders are listed, but the one you want, is a Narco from the late 70's. It is discrete components and all TTL. The transmitter probably won't work, but you only want the receiver. Pre-70's and early 70's stuff is mostly unusable due to their massive discrete components, and IC's that are no where to be traced.

With these, all you need is a serial shift register at say 10 times the clock rate, to do garble detection. You also need to swap the receive freq from 1030 to 1090 on one of them.

If you are trying to detect airplanes and plot their bearing and range, then you probably want to consider the DME (TACAN) channels (these are also available on eBay). Two of these will allow you to monitor the ground channel and the aircraft, and then all you need is a good DF setup for L-Band :-) Actually a good DF setup would be a superior solution to all the above...

Fellow radio folk, I could not resist. Merry Christmas! ;-)

Oh, as for the legalese... The attached is copyright by Bruce
(KC7GR) & Dana (no callsign yet) Lane. Anyone can perform it in any venue
they want as long as (1), they have fun doing it, and (2), our names
remain attached to it as the authors.

Enjoy!

-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-=-

'Single Cells' -- A Christmas filk

-=-=-=-=-=-=-=-

CHORUS

Single cells, single cells,
Batteries all the way!
Six-Volt, Nine-volt, Lithium,
Ni-Cad Double-AyAY!

Single cells, single cells,
Batteries all the way!
C-size, D-size, GelCell, Coin,
Pick some up today!

-=-=-=-=-=-=-=-=-=-=-

Dashing through the stores,
Your hair in disarray,
You picked up all your Christmas gifts,
your lights and your bouquet,

Then a stray thought struck,
with horrible insight,
you forgot the batteries,
AND it's Christmas night!

CHORUS

So now you're in a rush,
The stores close in an hour,
It looks like Johnny's Speak-and-Spell,
may be short on power,

Then just up ahead,
in garish neon lights,
A door sign that says 'Radio Shack'
your savior is in sight!

CHORUS

So having bought your fill,
Your're on your merry way,
With a load that's sure to raise
eyebrows at EPA!

You get home just in time,
five minutes 'fore midnight,

The power's out so you have to
install by candlelight!

CHORUS

You wake on Christmas morn'
Your brain all in a glaze,
Positive and Negative,
and something about 'phase?'

Down below your floor,
you hear a mighty 'BOOM!'
Maybe, if you're lucky,
it'll be cleaned up by June!

CHORUS and END.

oh... well, no I am not sure I can do it... but I thought I was able
to decode
them visually- maybe not though.. I dont know that much about how my
equipment

capabilities could limit me- it may very well be a physical impossibility... It seems right though, when I look at the wave and zoom in, I see several pulses spanning about 02 milliseconds... That would be about right, no?

Here is a jpg of what I'm analyzing.. please let me know if i'm dreaming here...

http://kaninekids.com/squawk/squawk.jpg

thanks for the help!!!

oooohh cool... Good idea with the DME and DF thing. As you guessed, I'm basically trying to build a homemade TCAS. I was figuring I wouldnt need to know if it was a mode123c reply, but having a receiver on 1030mhz would
mean I could, which would then give me the a/c altitude and squawk.

I'm not nearly as sharp with electronics, so I was hoping to solve the problem entirely in software- but it sounds like using an old transponder
with the freqs reversed would make a great receiver. thanks for your thoughts.

Yes it sounds damaged...

I have the TS140/TS680 service manual if it helps.

The ACC2 conn appears to be on the "Signal Unit", the input being signal PKD.

PKD then enters the switch unit into a 10K trimpot and one or two other R's and C's. The next active device it hits is an opamp that is also used as the microphone amplifier.

Is the mic input dead as well? I'd suspect this device (uPC11582) as a starting point.

Gimee a shout if u need more help/cct scan.

Cheers Bob VK2YQA

Hi

Have spent a lot of time looking for a rtty pgm on Linux. I came accross the decoder (works fine) but haven't found an encoder.

Anybody seen one?

Cheers Bob VK2YQA

There is a transmit program for RTTY at
http://www.dl8bcu.de/download/rtty

Or you could both transmit and receive RTTY with gmfsk:

http://hes.iki.fi/pub/ham/unix/linux/hfmodems/

The best source to look for ham Linux programs is
http://radio.linux.org.au

Only problem is that DME gear is disappearing from aircraft as fast as
newer GPS gear is being installed. The FAA has pretty much given it's
blessing to use GPS in lieu of DME in most cases, including instrument
approaches.

Try looking up the Ryan TCAD patents. You aren't the first to have
thought of using fruit from other transponder interrogators to find
traffic.

The cause of the "error" was wery easy, and i feel almost stupid...
A wire was in contact with ground on my little PCB-card that i use for
switching/interfacing purposes... With allmost no signal to the PKD as
result :-(

Does this program work with the non-gui console?

I run RHL 7.2, with no gui; am blind.

Thanks,

-Dave Hunt wx1g

I had an HP300 once that worked PERFECTLY for packet. I wish it was never stolen by the movers. They run on 2 AA batteries for a couple of hours.

Hi, I am trying to use a old PK-232 (no Pactor or MBX) and a TS-430 to connect to a MARS message board on HF using ARQ. Has anyone done this with this rig? I can send find but do not see any traffic or get a connect light? The remote station is hearing my request with its callsign and its sending to be.

Thanks

Richard

No. KPSK is a KDE application run while in an X session.

Perhaps a console program called psk31lx is a possibility. I haven't tried it. It may still be around. Debian types seems to know about it.

If your hardware is up to it, you could *try* DigiTalk under Wine, or better, VMWare. A long shot I know.

You see a series of pulses because the interrogations are repeated at a fairly high rate, several hundred times per second. Each interrogation shows up as a separate pulse in your plot, but the individual bits within each interrogation are hopelessly smeared together because your receiver bandwidth is much too small.

Did you use a TS-430? I am starting to think the lack of being able to adjust my AGC is keeping my PK-232 from seeing any aab messages and replying. But I have never gotten it to work so it could be the way I have my Pacratt software setup.

Any suggestions of setting up the software to opeerate on Amtor?

Thanks and 73

Its been a few years, but it seems I remember having to do a mod on the AGC to get it to fly on AMTOR.

This site: http://www.mods.dk   has a mod listed for the TS-430 and AMTOR.

I had a lot of fun with my TS-430 / PK-232 combo on AMTOR, including some good DX. It was a long time ago though. Sorry I can't remember more about the mod I did back then.

Good luck!

Are you sure about this? The interrogations should be on 1030 mhz and
the replies on 1090mhz (which is what I am monitoring...) and the
items I'm interpreting as pulses last approx .004 milliseconds-
wouldnt that be the same width as a .4 usecs?

Howdy, Bill!

We have tried high-speed packet several times, here in the Valley, and it always works out the same. - The high-speed link goes unused, and eventually ends up being forgotten. There are only a few Hams who are interested in high-speed packet here, not enough to make it fly. After going through the trouble of obtaining and installing HS stuff a couple of times and getting burned, at this point it would be hard to convince anyone here to try it again, at least any time in the near future.

Also; The towers we have access to are set up for VHF and UHF, but not for SHF frequencies. Gotta have feed line and antennas for that. It gets expensive in a hurry at the higher freqs.

We've successfully operated 9.6kb stuff (medium speed) on several occasions, but only as "backbone" links between nodes.

There was one 9.6kb user port on a local BBS for a few years but - you guessed it - nobody used it and it was eventually shut down. It was there, but we can't really say it was a success.

Years ago, before 9.6kb ready TNC's and radios were generally available, the theory was that nobody used 9.6kb because it was so difficult to set up. Just as soon as the 9.6kb stuff became "plug 'n play", we all thought, it would instantly become popular when Hams discovered how much nicer it was...

But, as we all know, the introduction of "plug 'n play" 9.6kb ready radios have not made the dramatic difference many of us thought it would. The theory was shot down. It sounded perfectly reasonable, (to me, at least) but it didn't hold up in the real world.

A central problem with high-speed packet is content. Once you get past the Hams who erroneously believe that high-speed packet will give them free internet access, what you are left with is content that a lower speed link could handle just as well, at a lot less trouble and expense.

Eventually it comes down to the few Hams who want to set up and enjoy high-speed links just for the heck of doing so, and there are not enough of those here in the Valley to make the effort worthwhile.

That isn't really anything to feel bad about though... The really successful, actively growing packet nets in the U.S. tend to be 1.2kb access with 9.6kb backbone links, so if nothing else, we are in good company.

Charles, N5PVL

I seriously doubt that any disrespect for the U.S. flag or "cashing in" was intended... In fact, I suspect that the display of the flag is intended as an indication of support for the USA in these troubling times.

You are right of course, that the ad is improper, but I doubt that any impropriety was actually intended.

As for flags of other nations, to me most of them are just colored cloth, no more and no less. There are a few that I respect, but very few. If I had a generic foriegn flag handy and had no access to toilet paper, well I guess you know what would end up happening with the foriegn flag.

That's not what I meant. I wouldn't have a problem with his
putting a picture of a flag beside the sale, but a real flag used to
hold his swap shop items is a whole different thing.

He probably grabs the flag and a stick, and like a hobo takes all
the stuff to the next swap meet...

Look it,

Where did I say anyone is entitled to credit for doing not one damn thing, my point was college in the basic sense is a business transaction, let me spell it out in a formula:

Tuition (i.e. Item of value) + Work (i.e. time invested in taking tests whatever) = Grade / Credit toward a degree (The deliverable item by the school or college)

You are so damn crtical of every thing....Jesus Christ sure glad I never had you for an instructor, you make the Indian professor (where I went to school) who takes 80% for a mathmatical sign reversal look like a nice guy.

Go ahead build your over-the-air VPN and let Rily Hollingsworth and the Federal Courts make the judgement call. In the final analysis of this whole affair they are the Gods of the air waves, not me, you or any other person. We all just have freaking opinions as to what the FCC and the couorts will really do not definitive answers.

This is why I hate internet news groups at times, one tries to answer another person's question and that person becomes beligerent and argumentive with the answer.

I am out here this is all pure Bravo Sierra as far as I am concerned.

I'm not planning on building any VPN network on amateur radio frequencies.
If it were legal, I might have. At least, for those occasions when I
need one.

And I haven't been trying to argue whether VPN is legal. I didn't
think it was, but I thought I'd ask.

In fact, we find out that there are times when encryption is okay --
for logging on to protect your password and for controlling amateur
satellites. I thought the question was worth asking and the results
bear it out.

I don't know about you, but I found the discussion quite helpful.

I think you're missing some very big things under the radar.

First, keep in mind that those involved in a technical pursuit often try to limit their communities to small, functional teams.

Second, many fundamental things about radio are often lost in the shuffle. For example: Jerry Sevick wrote an entire book about Balun and Unun RF transformers. This may sound weird, but it was actually ground breaking work on a neglected area of investigation. In most commercial applications "good enough" is usually as far as anyone goes. Sevick looked carefully at power handling issues and broad-band performance. His book is now a bible for the ham radio community and by the way, it's also a useful tool for most other users on SW.

The AMRAD group is experimenting with Low Frequency communications. They use exotic modulation techniques to dig signals out of the noise. They are working very carefully to optimize antenna performance. The electrically short nature of these antennas is quite a challenge.

There are others working on high performance receivers, Variable Frequency Oscillators with low phase noise, signal propagation tests and so forth.

What you need to realize is that most commercial applications are about what's reliable. Ham Radio is about the art of what's possible. Those are two very different ways of looking at the same technology.

Whether it's the bragging rights of a kid with a hand held radio talking to someone nearly 1000 km across the water on a fraction of a watt, or whether it's someone digging weak signals out of the noise, or someone trying to build a cheaper, smaller, or simply untried method of communication --it's all a technical hobby. It's about the art of what you can achieve.

Yes, there are lots of guys who sit on their butts every evening drinking beer, cussing at each other and the world, and generally making pests of themselves. I still think it's better than watching television. And although they are the ones you hear on the air most of the time, there are plenty of others who you DON'T hear on the air. They're too busy building their stuff, and using their licenses to do brief tests. Often the signals they put on the air are so close to the noise, that you'd be hard pressed to find them.

As for Part 15 development, if you're willing to live within the confines of what it is, then by all means use it. There is an interesting experimenter's band from 160 to 190 kHz which many hams play with, but in fact you don't need a license to work with it. You can also experiment with the 902 to 928 MHz band. But if you want to try your hand at troposcatter or EME, you'd better get a ham radio license.

This hobby is what you make of it. It's not about wiring the last mile to your house. It's a playground. It's an educational tool. And in emergencies, it's also a free form infrastructure for getting emergency traffic out to the rest of the world.

Oh and by the way, APRS was a system concept developed first in ham radio. Maybe you've heard of Capstone and many other radio location broadcast schemes --but APRS was up and running years before. Likewise, the scheme used by our SCADA telemetry system where I work had been proven on the air back in late 1970s.

You say there's no innovation. Well, in a mainstream sense you're right. But that's not what this hobby's about. And if you look among electrical engineers, you'll find a preponderance of ham radio enthusiasts as well.

That's the nature of the hobby today. Oh, and speaking as one who was there, many of the early computer builders of the late 1970s and early 1980s were hams. Hams were the early adopters of the home computing movement. And one of the very first handful of computerized bulletin boards in the world was a ham radio board: Yes, it belonged to AMRAD, and I was a user.

Yet, despite the storied history, ham radio doesn't have the word computer in it. Don't judge the state of the hobby by what we do or don't do with computers...

73,

Jake Brodsky, AB3A mailto:frussle@erols.com

Stop it! You're killing me! When I read about the guy going "hobo" and
fixing himself up a bindlestiff, I ended up shooting coffee out of my nose,
all over my keyboard.

I hope you're proud of yourself!

> the noise, that you'd be hard pressed to find them.
>
> As for Part 15 development, if you're willing to live within the
> confines of what it is, then by all means use it. There is an
> interesting experimenter's band from 160 to 190 kHz which many hams

> play with, but in fact you don't need a license to work with it. You can also experiment with the 902 to 928 MHz band. But if you want to try your hand at troposcatter or EME, you'd better get a ham radio license.
>
> This hobby is what you make of it. It's not about wiring the last mile to your house. It's a playground. It's an educational tool. And in emergencies, it's also a free form infrastructure for getting emergency traffic out to the rest of the world.
>
> Oh and by the way, APRS was a system concept developed first in ham radio. Maybe you've heard of Capstone and many other radio location broadcast schemes --but APRS was up and running years before. Likewise, the scheme used by our SCADA telemetry system where I work had been proven on the air back in late 1970s.
>
> You say there's no innovation. Well, in a mainstream sense you're right. But that's not what this hobby's about. And if you look among electrical engineers, you'll find a preponderance of ham radio enthusiasts as well.
>
> That's the nature of the hobby today. Oh, and speaking as one who was there, many of the early computer builders of the late 1970s and early 1980s were hams. Hams were the early adopters of the home computing movement. And one of the very first handful of computerized bulletin boards in the world was a ham radio board: Yes, it belonged to AMRAD, and I was a user.
>
> Yet, despite the storied history, ham radio doesn't have the word computer in it. Don't judge the state of the hobby by what we do or don't do with computers...

Bzzzt. Wrong answer. You lose. Next contestant please.

Sec 97.211, (b)

(b) A telecommand station may transmit special codes intended to
obscure the meaning of telecommand messages to the station in space
operation.

There is no mention I can find of passwords in the current regs.

<begin speculation>

I would expect if you were to ask the FCC if it were OK to use encryption
to protect a remote earth station from unauthorized access, they would
probably say it was OK as long as the encryption was only for access control.

This, however, remains to be seen.

Who will write the letter?

<end speculation>

--
Jim, if you can't quote the reg, you're just blowing smoke, Pennino

Hi everybody,

I've just completed to upload the web site of the new Digimit 2002
all-bands digital SSB/CW HF transmitter with lot of information.

If interested, please visit:

http://www.microtelecom.it/digimit/index.htm

Best regards,
nico - IV3NWV

Oh jeez, a syntactics nitpick.

OK, you da man. Feel better now?

Sec 97.211, (b) still stands on it's own merits.

Or are the exceptions in the enforcement and not in the rules?

As stated earlier, the only explicit exemptions found are for satellite
control.

In my opinion, the FCC probably doesn't care if the encryption is limited
purely to authentication for the purposes of remote control, but it is
easy enough to find out for sure.

If anyone is really, really, really concerned, write the FCC and ask for
an official opinion.

In general, the FCC follows the simplest rule for such queries:

"Ask and you will be denied."

Note that challange-response security has been in use for the control
of packet nodes and servers since at least 1988. This is a tad different
situation than encryption, since all data is sent in the clear. Of course
the shared secret must be installed into the remote node in some manner,
usually burned into an eprom or entered on-site via an RS-232 link.

As I said, there is no exceptions whatsoever for the encryption of passwords in the rules.

Hank got it right.   The protocols I mention do not set up an encrypted data stream and send the password over that.

Strictly speaking however, they do use encryption techniques.   A classical (and oversimplified) approach would be to take a known (typically random) number and encrypt it (using either private key cryptography and a shared secret key, or public key crypto and the private key of the sender).   If the recipient can decrypt the number back to the known value then he knows the sender had either the shared secret, or the private key (the secret half of a public/private key pair) and is probably who he says he is (unless the secret has been stolen).   Lots of variations, but this is the basic idea.   Any good book on applied cryptography will discuss the other variants.

From the POV of this discussion, the idea is that the data item being obscured not is particularly interesting nor would its contents allow sending prohibited transmissions.   (However I guess a 32 bit field could on randomly occasion contain ASCII representations of 4 letter words :-)).   I guess we can take Hank's example as an existence proof of the acceptability of this approach to the FCC.

Obviously, if the remote node is a computer with an operator interface, you can just type the secret in. (Although this could get tedious for the cryptographically stronger approaches)

Don

Exactly.

The "classic example" is 85-105. Took quite a bit of time to put
together the request, get the ARRL to sponsor it, gather comments,
etc. etc. etc.

Hi all

This may seem like an odd question but has anybody seen, or devised, a

method for operating the soundcard in a pc over a network? I would like to
be able to use the soundcard in my PC, which is connected to the HF radio,
from another pc over a wireless lan?

Thanks

Alex

Larry,

Don't get upset over this. This was just an example of how insane this country has become. People get offended over everything anymore and lash out over the stupidist little things. People just have too much time on their hands today so the only thing they know how to do is become offended and complain about everything.

I use Netmeeting remote desktop sharing for a similar application here.
So that I can check APRS activity without leaving my office ;-)

regards - Steve

Hank

Thanks for that,

I thought about vnc but I suspect speed may be a problem. What I am after and may have to end up writing is some software that will pass raw data to and from the soundcard on a remote pc over a lan.

Alex

Check out www.tightvnc.com

This should work well even over a modem.

Steve

Thanks for that. I should have mentioned that I always use tight vnc.

My aim is to be able to run psk software ovre a wireless network (11Mb). I did some test today with vnc and MixW and the results were not too bad I stumbeled across Analyzer2000 which appears to have a remote client facility which I am currently downloading to experiment with.

Alex

Hello,

at first please read some explanations about the analog mode
SSTV (slow scan television, still pictures in b&w or colour
are exchanged besides vocal contact). It has nothing in
common with packet, pactor or the like, even if run over a
PC soundcard...

Look at http://www.ultranet.com/~sstv

I've read and reread and really gotten nowhere, can someone inform me as to what mode and frequencies might be best to make a few DX contacts on 6 meter packet? I'm thinking APRS but read somewhere that 9600 baud was the way to go, if I remember right 9600 is not allowed on 6 meters? I've found several frequencies listed 50.620, 53.530 and a few others, hearing nothing at all. tnx

9600 baud (top speed 19,200 baud) is permitted on 6 meters.

[U.S. Rules:]
HF and lower frequencies: 300 baud
10m: 1200 baud
VHF (all 3 bands): 19,600 per rules; standard UART speed = 19,200 baud
70cm: 57,600 baud.
33cm and higher frequencies: No limit.

I'm willing to try, but you will have to rotate your beam 180 degrees, and
point it east to NJ.

Hi Folks:
I know this is an OLD topic: I've used a Commodore and Digicom (I think) on packet a long time ago.. Then, there seemed to be some logic to the SSID's used.. If I remember right, when a call with an SSID of 2 went through a digipeater, the digipeater would take 15 and subract that SSID and that would be the digipeated call. Ex, if I were to use KB2MEN-1, the Digipeater would transmit KB2MEN-14. On the Commodore, it used hex (1~F). Back then, you could tell what a station was by it's SSID. A node had maybe -2, and a digi -10, a PBBS -4, I can't remember what -3 was.. Maybe -3 was a digi..
My question, was/is there a standard to what SSID to use for what?
Thanks!
Harry

I built a cable following the schematic for the Yaesu VX-1R illustrated in

http://www.icongrp.com/~sllewd/pcware.htm.

I am using the correct s/w but cannot get it to read or to program the radio.

Does anyone know if this schematic will work? Is there some other?

There is the NAS project at http://radscan.com/nas/nas-links.html
It was developed on Linux.

I think recently, it has been ported to Windows. Check out
http://linux.intra-links.net/ Also, check out the NAS mailing-list
archives.

A long while back, when I was searching for network-audio systems, I
discovered a few Windoze-only systems, but I don't remember what they
were.

This type of "standard" (if any) varied by region.

In my area:
     -3 was for TCP/IP on 2m.
     -5 was for TCP/IP on 70cm.

Usually:
     -0 (i.e. no SSID) was for a live person (or a BBS if a club call).
     -1 is typically for an individual maildrop (including a TNC's maildrop).
     other SSID's indicated automated functions.

You are correct that NET/ROM repeating may use (15-SSID) to generate a new SSID for an outgoing, repeated session. For that reason, SSIDs above 7 (i.e. 8-15) are generally not used on the air by their originating stations. True digipeating will NOT alter the SSID.

OK. Thanks for the good information. Are you saying NET/ROM as in a
node, my SSID would be 15-SSID?
Harry

I am saying that when you pass through a node by connecting in then connecting out, yes. Example: You connect in as CALL-3. If you then connect out, that connection out will go out as CALL-12. This is not the same as a NET/ROM to NET/ROM transport when you have requested a connection at one node to a non-adjacent node; that's an automatically routed connection. I'm talking about MANUALLY made connections.

There are no standards for SSID.

Some areas do one thing, some do another, some simply
do not worry about it at all. The SSID is not very important.

Some NET/ROM implementations change your SSID when
you downlink from them, some do not.

Again, it is just not important.

Has been like this since the very start of packet.

We tend to use 0 for the BBS callsign, -1 for the node callsign,
(and -2/-3, -4/-5 for second and third systems with the
same call etc.) but some folks do it differently.

Same goes for IP addresses. We tend to use 44.*.*.16 for
the "main router" at a given location, and then go up and down
from that for other hosts at the same location. Sometimes we

subnet 255.255.255.224 for systems that are tightly coupled
but not at the same location ... but this use is different in different
places, just like the SSID use.

Same comments for NET/ROM alias. We tend to use something
that hints at the location, like MTHOOD for Mount Hood, or
PARET for Parrett Mountain, or BALDPK for Bald Peak.
We tend to use things like RLIMB for the BBS alias, but that
is not at all standardized and we have things like WCEOC
and WCBBS for the Washington County EOC system node
and BBS alias:-)

There were several attempts, mostly in the 1984 - 1987 time
frame, to standardize SSID use. Too many attempts, and no
agreement every reached ;-(The same was true for NET/ROM
aliases in the 1986 - 1989 time frame. So we generally have
chaos and anarchy.

--

   ... Hank

Chaos, panic, and disorder - my work here is done.

Hey I am still using the C128 and Digicom V5. I pass traffic
from internet to MARS PBBS at Schofield Barracks which comes
in from Ft Huachuca AZ.   At AB6USA (Schofield) there is some
kind of problem in their winlink 2.9 software settings. Or
maybe its my settings in Digicom. I seem to remember something
fuzzy about a certain param setting would prevent digipeating
thru a digipeater to get to the destination. Even if only
one digi is in the path.   Well thats the problem with AB6USA!
I can send traffic to them all day without a frame reject running
1 watt output on VHF.   I can also "connect" to the MARS
digi on top of a Mountain just behind AB6USA, but I cannot
Connect to AB6USA via the digi (MARS). What param in
Winlink2.9 or DIGICOM could put this block into effect.
Just to include the fact that we run an "un-proto" net on
Monday nights via the MARS digi with no problem at all.
Some of our MARS guys however cannot reach AB6USA direct due to
terrain, and they are the ones that need to capability of using
the MARS digi to get to AB6USA.   Any ideas on what
params we should be changing to get thru MARS to AB6USA???
Either in Winlink2.9 or in DIGICOM.   Dont think its in Digicom
as I am the only one using it, and all the others are using
PC's of various kinds and winlink and they cant do it either.
Any Help posted here or to my email (jfenn@lava.net) would
be worth a meg of thanks.
                  Joe/ABM6JF/KH6JF

If you are interested in PSK, MFSK, HELL, RTTY, SSTV or any other mode which uses the soundcard then you will find my site of interest. It carries most software's and is regularly udated.

www.g3vfp.org

Sorry Dave but no! I have checked out psk and those sound card
things but they cannot maintain integrity for msg traffic.
Only G-tor and/or Pactor can do it absolutely. Last time I looked
nothing using a sound card can handshake frames of text and doing
a checksum on them before the data is accepted. Pactor and
Packet both do this therefore the integrity of msg traffic as
we use in MARS is never sacrificed!

Joe

PSK, RTTY and similar modes don't have the error correction that packet has, that is true. However, it's not the soundcard that does it, it's the protocol. There are a few programs which can do the packet modes via the soundcard and they have similar integrity to the same modes using a TNC.

Granted, the numbers of programs which do this via the soundcard is small compared to the number that do PSK and similar modes, probably due to the fact that packet has lost popularity at the same time that soundcard interfaces were becoming popular. And, actually, AX.25 is a sort of tough thing to do in software. But it's not impossible, and programs like MixW do it quite adequately.

What I don't understand is why someone hasn't combined the relative resistance to errors on bad circuits that PSK and some of these modes demonstrate, with the error correction of packet.

..

Hi Guys,
I'm heading out tonight and taking the Tech Exam. Wish me luck.. My

Question is.. Does anyone know any Packet system in NYC ? What's the callsign and Freq. ?

Thanks

Rickie

I am planning to build a simple rc link for learning radio
electronics. Though i am new to radio electronics, i have quite some
experience in digital electronics. I intent to build a transmitter
receiver pair that works well for a distance of 20 mts. i want to
transmit digital pulses, not audio. I want a to make a simple system
such that at the transmitter side, if i flip a switch an led will turn
on/off correspondingly.
As far as i have learnt thru the internet and usenet groups fsk
modulation would be best. Please suggest if fsk is the thing for me or
not.
Also could anyone please give me a website where i can find as much
information that is needed for the project i mentioned above.
any help would be highly appreciated.

I need to locate some software for my PK-232 to run on Linux so I can work
CW, RTTY, AMTOR, PACTOR, PACKET, etc. Can anyone give me a handle on this?

Thanks in advance. Bill ...

Would like to run PSK/HELL portable,with my FT817----wonder if anyone has any experience and/or suggestions for either a Palm Top,or really small laptop.Ability to run off 12V ext.power would be a plus; soundcard,or at least a PCM slot for a soundcard would be a necessity.

Currently running digital modes with a Dell 333 mhz notebook, but don't want to carry it hiking because of weight,ect.
73,
Ed N4ZUM

I've just connected up a Mk1 Tiny 2 (with DSP State Machine board)that was last used about 10yrs ago. It appears to be working and receives very well but seems to be having problems on transmit - cannot connect to anything.

I've briefly monitored the transmission on another rx but all I hear is what appears to be a single tone but no typical packet sound - anyone have any idea what the problem might be.

The rig is a Kenwood TH-F7E
WinPack (demo) V6.80

Any advice/suggestions appreciated.

I don't know if this has been posted before, but it's quite
interesting. Plainly visible in one photo is the +27dBm
YDI amplifier and these are the same gridded dish antennas
I described in "how to do long haul on 802.11b" a while
ago. I wasn't making it up, and it's 100% radio.

Careful with the facts; the original story indicated they're running +30dBm (1W) using 11Mbit/sec 802.11b, and getting 1Mbit/sec throughput, and there was no FCC action.

> After FCC action - power reduction (300k bit/sec)
> http://www.computerworld.com/mobiletopics/mobile/story/0,10801,76118,00.html

There was no FCC action that I'm aware of; the agency reduced the power voluntarily when it was pointed out to them that they were in excess of the Part 15 limits. If those are the +24dBi gridded dish antennas I'm familiar with (and they sure look like it), then they'd be legal right around +27dBm (500mW) of transmit power in a point-to-point configuration allowing for +1dB of connector/feedline loss.

Contrary to a statement made about running larger antennas instead
of more power, there are certainly limits on antenna gain at
2.4GHz. At 5.8GHz, however, there is no limit - but the link is
running at 2.4GHz as far as I can tell.

They must be running right at the hairy edge of connectivity to
300Kbit/sec since 802.11b doesn't fall-back below 1Mbit/sec.

There was FCC action - ask Riley Hollingsworth. As you may know the first
action is usually just a letter - I'm sure that's all it took in this case.

You're right about the original being 11M bits/sec, I looked at the wrong
figure further down in the story. Nerveless, it still was a pretty
significant reduction in data rates.

I disagree. I get 250mW after applying the reduction equation in 47 CFR 15.247.
(24 - 6) / 3 = -6dB, which from 1W means 250mW.

What limit? If I wanted to hook up a 30' wide dish optimized for 2.4, I could
do it (as far as the rules are concerned and with the correct power reduction).
:-)

Serves me right for rattling numbers off the top of my head.
I was actually thinking of a 21dBi gridded dish (see
http://www.netnimble.net/21dbigridan.html)from a link
I'd worked on and had more recently been looking at a 24dBi
dish. The actual budget I'd calculated worked out included a
21dBi antenna and 2dB of feedline and connector loss and comes
to pretty much exactly +27dBm. I believe the ultimate
answer is EIRP is +48dBm regardless of transmitter power and
antenna gain.

Sorry about that.

I am trying Flexnet for the first time. I have installed Flex32 on my WinXP PC. I am using a 6PACK TNC-2. I have never used the DOS version.

I tune my radio to a nearby Flexnet "Destination."

I run Flexntl. Apparently, the program sees a valid TNC on COM2.
When I select Trace, I can see some RX from the node.

What do I do next to access the BBS, do a CQ, etc? I tried Flextalk,
but couldn't get it to key my radio or connect to anything.

Is there a tutorial for Flex32 or some screen shots? A help file?
Anything at all?

Ken KC2JDY

At http://www.northeastflexnet.org/ you can find the docs to Flex32 translated in English.

The Flextalk application bundled with Flex32 assumes that you have 9.6kb access and 72kb backbone links, which we don't see much of, here in the U.S.. It is designed for sending sound files back and forth, a "digital voice over packet" setup that our packet nets in the U.S. are not up to, yet.

Apparently they have a lot of fun with packet in Europe!

The best terminal program for Flex32 is Paxon, which you can download at:

http://www.paxon.de/download.php

It is a really nice packet terminal, with lots of great features. I've tried out another Flex32-ready term program called "NBF", but found that I liked Paxon better. If you don't like Paxon (though I don't see how you could help it) try a web search on " NBF Packet Radio" and it will come up.

I use Flex32 with a 6-pack TNC and Paxon. When you run Paxon, Flex32 automagically comes up to drive it, so you are only one mouse click away from packet at any given time. Not bad!

Paxon has a lot of sound options.. You can assign a unique sound (wav files) to just about anything that happens, including connects from specific callsigns. As an example: A buddy connects to my packet station in the mornings, to see if I'm ready to go out for a "cuppa cawfee". I assigned a distinctive "foghorn" sound to incoming connections from his callsign. - So if I sleep late, it's "BOOO-WAAAH!" and I come rolling out of the sack to answer his connect. (Everybody else has a discrete, unobtrusive little beep.)

Good luck with Flex32, and don't forget to let us know how it works out!

I'm glad to hear that, Steve. Now we quit wasting time on 802.11b and get

back to discussing real amateur packet radio networking, something that a
much larger number of hams have interest in.

Charles, N5PVL

Hi

charlesb wrote:
> Apparently they have a lot of fun with packet in Europe!

We do, at least in southern Germany and a few of the countries a little
further to the east. They have links, with more than 1MBit/s in some

locations there. ;>

> The best terminal program for Flex32 is Paxon, which you can download at:

Nice to see, how far Ulf's and Gerald's program is known by now. :)

> [...] When you run Paxon, Flex32
> automagically comes up to drive it, so you are only one mouse click away
> from packet at any given time. Not bad!

I'll assume that you switched to englisch user-interface by "Extras -> Sprache", double-clicking on "English" and restarting Paxon.

For this to work Paxon needs to find a running Flexnet-installation when it's first configured to use Flexnet. To do this do:

- Start Flexnet
- Start Paxon
- click on Settings
- go to the tab "Devices"
- click Add
- doubleclick PC/Flexnet
- Click Ok

If Flexnet was running Paxon should now be able use it. If you start Paxon from now on, it will test for a running PC/Flexnet and (if it wasn't running yet) start it.

Ciao and have fun with Paxon. :)

802.11b? Now that's another subject, and very popular.
Check out the Sharp Zaurus (I have the 5500) and then do
a google search on that. We are talking Linux and WiFi in
your hand. I just flashed the new openzaurus ROM and it
is about as much fun as I can stand... I used it to sniff out a
network in Dallas on a recent IBM class I had to take, and
then hooked-up to the Internet for free from my Hotel.

Thanks, Charles.

No wonder I couldn't communicate; I didn't have a terminal program installed.

I didn't see any mention of Paxon at northeastflexnet.org. Maybe it's in there somewhere, but I couldn't find it. I have not found that site particularly helpful and I am pretty good at RTFM.

OK. Some progress made with Paxon. At least my radio keys on transmit. However, I am unable to link to a nearby local node ("Link Failure"). Inasmuch as I am not hearing *anything* on this frequency, it is possible that the node is down.

Paxon help is in German, so it doen't help me. My local Flexnet guru is DOS-only guy. No one else in my club knows anything about Flexnet.

I see on the node list that the nearby node has a "-4" SSID. Do I need to tell Paxon that, and how do I tell it that?

Well, Flexnet itself is only a node for device-drivers. It also contains
a very simple digipeating-node, but that thing is _reall_ simple.

> OK. Some progress made with Paxon. At least my radio keys on
> transmit.

Good. That tells us, that you have PC/Flexnet and Paxon basically
configured right.

> However, I am unable to link to a nearby local node ("Link
> Failure"). Inasmuch as I am not hearing *anything* on this frequency,
> it is possible that the node is down.

Might be.

> Paxon help is in German, so it doen't help me. My local Flexnet guru

Well, Paxon is a german software, after all. :) And I guess nobody has
volunteerd yet, to translate it.

> I see on the node list that the nearby node has a "-4" SSID. Do I
> need to tell Paxon that, and how do I tell it that?

In the connect-window (you get that by typing <ALT>-C or "<ESC> and then
"C" or <ENTER>) you type the destination-Call into the upper box, your
callsign into the lower box and you select the device to use in the
listbox to the right. If in that listbox you only have the
"LOOP"-device, you don't have Flexnet configured right. (But as your TRX
starts to transmit sometimes, you seem to be ok there)

If the digipeater has the SSID "-4" you need to add that to it's
callsign in the upper box. Here (for my digi) that would look like
"DB0HHN-4".

By the way: In the Paxon-settings you need to check _every_ SSID that
you might want to use for connecting out. Because Paxon (by itself) only
uses those SSIDs you select there.

Ciao, Jan

Thanks again for your help.  I am still not able to connect to the
local node, but have requested the station operator to help me debug.

I suspect that there may be something wrong with my TNC.  It is an
MFJ-1702C with a 6PACK EPROM.  I installed it and made the
MFJ-documented mods required for TheNet.  The STA/Mail LED would not
go out.  My club's Flexnet expert removed Jumper 21 and that solved
```

that problem.

When I try to connect (listening on a scanner), sometimes I get a
series of long tones with some modulation (I would guess 300 Hz).
Sometimes I only get a series of 1/2 second staticky bursts.

What should the handshaking sound like upon connnect? Is there a WAV
file anywhere?

I should add that this is at 1200 baud. I found a sound file for 300
baud packet.

The short bursts are almost certainly wrong. Once the rig starts
doing this, nothing gets it back to TX a modulated tone except

changing the delay or duplex parameter in Flexctl. No particular value works -- just changing whatever it is causes an exchange between the PC and TNC that seems to get things back on track.

I also suspect the TNC-radio (VX-150) cable. The specs given by Yaesu/Vertex in the manual didn't work at all (wouldn't key the radio) and I am now using revised specs guesstimated by Yaesu techs. Yaesu HT's have a combined Mic/PTT lead that is split in my cable with a 1K resistor (PTT) and a 1 mF cap (Mic). The original specs were 2K and 10mF.

Because of the dearth of quality documentation in English and the possibility of problems in so many components, this is extremely difficult and frustrating.

Creber(MW1AAH) <dorian@no-spam-spamcop.net> writes
>Hi there,
>
>Anyone managed to get AGW working on Win xp with ui-view32 ??

Running at this very moment on my PC, and on the PCs of an awful lot of
other users... If your installation of AGWPE will work with any program,
then it should work with UI-View32 without any problem.

So you really need to explain what specific problem you are having, what
hardware you are trying to use - sound card, TNC, etc - and what version
of AGWPE you are using.

Ok, 1k2-packet sounds something like a "screeking" sound. 9k6 is just "noise". So what you seem to have there _could_ be a 9k6 signal. I don't have _any_ experience with your kind of hardware though. Here in Germany we mostly use something we call a TNC2-compatible hardware.

When you open the PC/Flexnet Control Center, and there the "Tools -> Parameters" window. Then you should have the "6PACK" driver somewhere there. Is the setting for "Baudrate" (_not_ RS232 Baudrate, but I guess you would have figured that out correctly) correctly set to 1200? Also the "Full Duplex"-Option should be empty and the TxDelay set to something around 20 (I don't know the required setting for your TRX here)?

> The short bursts are almost certainly wrong. Once the rig starts

> between the PC and TNC that seems to get things back on track.

I'd guess that, since 6PACK doesn't have any real "intelligence" in the TNC, that Flexnet makes a reset of the hardware when you change any parameters. That's why changing any of those settings seems to make something right. But I don't know what those "static"-bursts are. I still suspect an 9k6-signal (or maybe a 4k8-signal, but I'm not sure how that would sound) though.

> I also suspect the TNC-radio (VX-150) cable. The specs given by

Hm, might be. I had to build such a cable for my FT-8500, but it has an extra pin for the PTT.

> Because of the dearth of quality documentation in English and the

Hey, don't worry, the english documentation mostly is still better than the german one. ;>

OK, Icom 746 hooked up to a RASCAL to a PC running Digipan.
COM port configured so it keys the rig, but I never get the bright
yellow-green stripe in the parallel lines.
Audio cables connected to sound card via accessory jack in the Icom.

Just need a few hints...I will do this primarily in evenings, so am checking
freqs from 18 MHZ and down.

What do I need to do to see something in the Spectrum Window?

many 73s,

Gary

Try setting the rig to 14.0700 USB. If you see anything, click the mouse on
the waterfall display.

Thanks for the reply!

Yep, doing that right now, and I have the diamond over one of the stripes
but all the characters on the display are gibberish.

There is a possibility that you will pull up DX that the other modes can't with PSK31, as I have seen it copy and decode signals that I could not hear. With CW and SSB, if you can't hear them, you can't work them.

But that isn't what I would call a MUCH greater chance. It's better, but not radically so.

The traditional mode for digital DX is RTTY, perhaps because of old commercial and government surplus RTTY equipment that was once scattered around the world, in odd places. There are cstill a lot of hard-core RTTY DX'ers out there.

My favorite digital DX contact was done over ten years ago, in AMTOR mode with a station in Djerbouti, in east Africa. The guy was fun to QSO with, and the link held up for close to 45 minutes. I am a DX ragchewer, a sort of anti-DX'er who is not content to exchange callsigns and obligatory "5-9's"... I like to actually get to know those distant hams, so I suppose I would never make it as a contester. Too gabby and too slow!

My favorite PSK-31 contact was one of my first. When I first set up PSK31, I didn't have a decent HF antenna. I intended to just monitor, not transmit because all I had was 60 feet of "magnet wire", and that stuff that is about the diameter of thread. An SWL antenna. - But I decided to see if the thing would tune up with my rigs autotuner, and it did! Running low power, I QSO'd with a Japanese station, something I had never done before.

(Here's the good part) After the QSO, I went outside to admire the spidery antenna, and discovered that the rig's autotuner had melted the thin wire, and my QSO had been somehow done on about 6 feet of wire that still remained. The rest has fallen down on the ground, no longer connected to the rig.

It brought to mind a time when I had 100 watts and a tribander to work with on SSB, and never could get a contact with Japan.

The only really pioneering work I ever did with digital ham radio resulted from a mixup, close to 20 years ago. I made two mistakes... I had my PK-232 in AMTOR mode when I thought it was in PACKET mode, and my VHF radio was on the local voice repeater frequency, not the Packet freq. - So I ended up sending an AMTOR FEC "CQ" out over the local repeater - and by doing so, I was one of the very first hams to experiment with a forward error-correcting protocol over a digital repeater!

Yes, it was a proud moment when I realized what I had done, and I can assure you that my "accomplishment" was noted by the local hams! I think they've all forgotten about it now, but for a while there, I was quite famous. Everybody seemed to have a comment about it.

I don't use digipan but, the concept is to adjust the signal such that signal to noise and distortion are maintained as green stripes. You do this by maintaining enough volume to decode but not to over drive. My set up has

the windos volume controls for the sound card at about 1/2 or maybe slight
above. One other item is to make certain you always select LSB, if you
select USB then signal will be inverted thus yielding nonsense characters.

PSK works on tuning into a specific tone "channel", e.g. 1011 Hz off center
frequency which in most programs can be adjusted by grabbing the diamond and
moving it to the line in the water fall. Believe it or not PSK is one heck
of a lot easier to tune than PACTOR, Packet (HF) or AMATOR. One program I
was recent shown and have tried is MixW this one seems to be very good and
has several different modes included. The only problem is after several days
of use the program reminds you to register with a screen that pops up every
time you change mode. The web site is at http://www.mixw.net/ , there are a
lot of programs and the best thing to do is try them out until you find one
that suits your needs.

73,
I Ivanovich

There is a "farm" of several 1000 ft. towers conveniently located in La Feria TX to cover the bulk of the lower Rio Grande Valley, on both sides of the border. Some are for TV, others for commercial radio services. Space on some of these towers has been donated to Amateurs here.

We don't climb those towers. Only professional climbers do that. What we do is hook our stuff up to special antennas/feedlines already in place that handle several radios at once. One small drawback is that we must have seperate transmitters and recievers due to the antenna setup on those towers, even for single port packet nodes. For repeaters, it's done that way anyway of course. Seperate transmitting and recieving antennas. The heliax is as big around as my arm, the combiners have a forest of pigtails going into them. It's in a nice air-conditioned building at the base of the tower. Everything has to be neat and "ship-shape", in a metal cabinet. We can leave a keyboard and monitor out on top of the cabinet for a packet node, but that's about as junky as it gets.

Besides these big towers, there are 400-500 ft. towers dotted around the Valley. We use these for a linked repeater system and sometimes for packet stuff. The linked repeater system gives you handy-talkie access throughout most of the Valley, something the centrally located repeaters at 900 ft. can't always deliver.

Since the RGV is semi-tropical like Florida, we get Hams here from all over the country. Lots of great Hams. The ground is almost perfect due to the high water table of salty water from the gulf. The big drawback down here is the corrosive salty dust that blows in from the coast and coats antennas, eventually eating them up. Other than that, it's Ham Radio heaven down here.

I've noticed that the repeater on South Padre Island always seems to need work during spring break. Why do those guys need binoculars in order to go up on top of a hotel and fix a repeater?

Do not be too certain about that.
There are folks here who could well have taught that class.

Generally, encryption for the purposes of authentication is allowed in the amateur service. E.g, authentication protocols such as PPP/CHAP are probably fine. Even SSL/TLS or SSH certificate-based >authentication< would probably also be OK if you used null encryption for actual data transport. So you don't really have to go as far as one-time passwords.

The one exception in Part 97 that I am aware of is that encryption of the tracking, telemetry and command stream (i.e. TT&C) between a controlling ground station and an amateur satellite is allowed (so that someone can't hack the satellite).

Also, folks are not entirely correct in saying that most/all university Acceptable Use Policies (AUPs) would prohibit connecting the university network to an un-encrypted (i.e., clear text) amateur radio data link.

First, if the link is effectively "outside" their firewall and you use appropriate protocols, this would most certainly be allowed (by the university...still the issue with the FCC). For example, most uni's allow POP/IMAP from outside to access email. If you use an authentication mechanisms like CRAM-MD5, DIGEST-MD5 or APOP, your password will not be sent in the clear. (Although, of course, the transferred content will be visible). You could do terminal login using SSH key-based authentication (with encryption turned off, of course).

Second, most would allow it for research or educational purposes. (But probably only if they were convinced that you knew what you were doing and had appropriate "adult" supervision.)

Now the FCC is another matter. Although I disagree with the sanctimonious tone taken by some of the other posters (hardly an example of good "elmering"), their conclusions about the acceptability of using a amateur radio link mostly for non-amateur radio purposes are probably correct. Although Part 97 is not always black and white on this (except in cases with obvious commercial/illegal purpose), the intent is that ham radio resources don't get tied up for non-amateur radio purposes.

Experimentation with and deployment of TCP/IP-based communications
over amateur digital links, and provisioning of gateways to the
Internet is a valid use of the amateur radio service, IMHO. (As much
so as an autopatch.) The key is in purpose of the traffic thus
carried, and the same restrictions as on an autopatch should apply.

Don Hoffman

Oh. I see. You already have to develop everything you
might ever do with amateur radio before you become a ham.

I didn't know that.

Eric Johnson

:
: Generally, encryption for the purposes of authentication is allowed
: in the amateur service. E.g, authentication protocols such as
: PPP/CHAP are probably fine. Even SSL/TLS or SSH certificate-based
: >authentication< would probably also be OK if you used null encryption
: for actual data transport. So you don't really have to go as far as
: one-time passwords.

Good. I'm very happy to see that it is permissible to
use encryption techniques to protect your passwords.

I figured that with the recent emphasis on security issues, it would be unusual if that option wasn't available soon. From the September draft of The National Strategy to Secure Cyberspace, page 5:

> The Federal government should not and, indeed, could not secure the computer networks of privately own banks, energy companies, transportation firms, or other parts of the private sector. The Federal government should not intrude into homes and small busineses, into universities, or local agencies and departments to create secure computer networks.
>
> Each American who depends on cyberspace, the network of information networks, must secure that part that they own or for which they are responsible.

I wonder if there will be any new rules to further secure ham radio connections to the Internet. Do the ham radio gateways generally authenticate their users or do they assume that anyone accessing them is a licensed amateur operator?

: The one exception in Part 97 that I am aware of is that encryption of
: the tracking, telemetry and command stream (i.e. TT&C) between a
: controlling ground station and an amateur satellite is allowed (so
: that someone can't hack the satellite).
:
: Also, folks are not entirely correct in saying that most/all
: university Acceptable Use Policies (AUPs) would prohibit connecting
: the university network to an un-encrypted (i.e., clear text) amateur
: radio data link.

In the cae of A&M, opening up the network itself in a manner which permits people who are not authorized to use the network is certainly prohibited by university rules. However, I haven't seen any prohibitions on users of the Texas A&M DSL using wireless in the home. So I wouldn't be at all surprised if there are a number of vulnerable openings directly into the university network that are accessible by wireless. I'd be surprised if any of these were on the ham bands.

: First, if the link is effectively "outside" their firewall and you use
: appropriate protocols, this would most certainly be allowed (by the
: university...still the issue with the FCC).   For example, most uni's
: allow POP/IMAP from outside to access email. If you use an
: authentication mechanisms like CRAM-MD5, DIGEST-MD5 or APOP, your
: password will not be sent in the clear. (Although, of course, the
: transferred content will be visible). You could do terminal login
: using SSH key-based authentication (with encryption turned off, of
: course).

That's a good idea. I hadn't thought about using SSH but with encryption turned off. I use SSH daily (like right now), but

I have always left the encryption turned on.

: Second, most would allow it for research or educational purposes.
: (But probably only if they were convinced that you knew what you were
: doing and had appropriate "adult" supervision.)

There is a ham radio club at A&M. My guess is that if they maintain a ham-based Internet connection for students who are ham operators, CIS (Computer Information Services) would take a very close look at what they are doing and would either require a firewall approved by CIS and under their control or would provide a connection outside the firewall.

CIS and others are also actively installing regular wireless systems in various buildings around campus including the libraries and the dining halls. But those are outside the firewall. If you are using your laptop in the library and you need access inside the firewall, you have to use VPN to access the campus network even though you are on campus. If you are in the main library, you can even check out a laptop to use while there.

I don't know how the wireless research is done. My guess is that internal firewalls are used to make sure that the internal networks are not exposed.

: Now the FCC is another matter. Although I disagree with the
: sanctimonious tone taken by some of the other posters (hardly an
: example of good "elmering"), their conclusions about the acceptability
: of using a amateur radio link mostly for non-amateur radio purposes
: are probably correct. Although Part 97 is not always black and white
: on this (except in cases with obvious commercial/illegal purpose), the
: intent is that ham radio resources don't get tied up for non-amateur
: radio purposes.

I think I see what you are getting at. Accessing a research paper from the library is not a ham radio hobby activity. But then I wouldn't think that using a phone patch to call your wife to tell her you'll be home in 5 minutes would be a hobby either.

So while I think I see what you mean, I'm not completely sure I see the distinction between that and some other amateur radio activities that are not directly hobby related.

When a ham uses his radio connection for Internet access, are the things accessed strictly things related to amateur radio? I can see that accessing the ARRL's web site or the FCC web site would be permissible as well as doing things like communicating with each other via the Internet when needed.

But how about things like checking out the latest news from CNN? Or looking up a recipe for your wife? Would those be considered hobby related and permissible? If those aren't permissible, then it would be clearly not permissible to access a research paper

from the library on the connection as well. If they are
permissible, I don't see the distinction.

: Experimentation with and deployment of TCP/IP-based communications
: over amateur digital links, and provisioning of gateways to the
: Internet is a valid use of the amateur radio service, IMHO. (As much
: so as an autopatch.) The key is in purpose of the traffic thus
: carried, and the same restrictions as on an autopatch should apply.

What are those restrictions? I've seen some, but I imagine there
are some that I don't know of.

Thanks. That was very informative and educational.

Eric Johnson

So why don't you guys just forget all this nonesense, and just apply for a temporary experimental license explaining to the FCC what you want to do. They will most likely grant it for a period of time. A friend of mine and I did this, and we got a license that lasted several years, that was good for two frequencies just outside two ham bands. I see those types of licenses all the time for all sorts of reasons. You just have to explain what/where you are doing and most likely they will grant it..

The key to these exceptions is whether you are trying to avoid using regular commercial services. For example, if calling your wife is long distance over phone from your present location or is chargeable minutes on your cell phone but is a free call via the phone patch, then it is against the rules. Or if you do it all the time, it might be against the rules. On the other hand, if it is only occasional, it will generally fall within the rules. Afterall you do need to use the phone patches once in a while just to be familiar with their use in case it ever is necessary to use it. Practice in the form of occasional use would be within the realm of the hobby.

An issue here is that this service is available by regular commercial means (i.e. a commercial ISP). If using the radio service to tie into the university avoids paying ISP fees then it would probably not be permissible, at least not on a regular basis.

In addition, ham radio communications are fundamentally for the development of an amateur's radio skills. Yes it is true that hams in QSO talk about all kinds of non-radio stuff but they have to have something to talk about. They develop and maintain the skills to establish and maintain a communication under the evershifting conditions radio propagation regardless of the topic of conversation. Yet there are limits on what they can talk about. For example, a ham who regularly tries to sell radio gear over the radio is stepping over the line. The occasional piece of equipment is fine.

There will always be gray areas. As one use is ruled on and either allowed or disallowed, a new technological development generates new gray areas.

Did your license allow commercial traffic? If so, then a very good
approach to the overall problem.

Otherwise, not a bad idea if one is playing with experimental
modulation techniques or link coding schemes.   Probably overkill if
all that is being proposed is use of standard Internet protoocols over
amateur digital modes.

I've tried to stay out of this discussion, but...

You don't need an experimental license for building local, high-speed data links to run encrypted traffic.

Off-the-shelf 802.11b hardware easily provides an 11mb/s solution at distances in excess of 10 miles. A 24dBi-gain antenna is under $100, a PC-Card or USB radio (i.e., 802.11b network card) is under $100. The only high-ticket item might be a power amplifier, these run something like $500 but have the advantage

of being mast-mounted and thus obviating feedline
loss. You might not need an amplifier even for a
longer link (5-10 miles) if you're willing run at
a lower speed, say 2 or 5.5 Mbp/s. In a point-to-point
link, Part 15 permits about +27dBm into an antenna/feedline
system with a total gain around +22dBi (that's a 24dBi
antenna and about 2dB of feedline loss to the antenna).

Part 15, no content restrictions, plug and play, and
it makes the 1200 baud vs. 9600 baud discussion look
positively arcane. I'm speaking from personal experience
here, too.

I had a 1.6 Mbps Symphony link (100 mW into an amp) for a couple of years, and a RangeLAN2 link (500 mW) for about another year. While I thought it was pretty neat, and thought several people would jump on the bandwagon (we were 64k ISDN before), it turned out that I was the only one spending money. Even after we proved it worked, the motto seemed to be "you build it, I will come."

Once Cox wired up everyone for cable modems, the thrill was gone. Who wants shared 1 Mbps at about $1k a node, when you can get 2 Mbps for $40 a month, eh.

Even now I get requests to give away my old equipment, and I have to tell them I sold it all on eBay to people who understand the value of cost/performance and ownership.

I would say that it is pretty much plug and play, we could depend on every winter the link going out as ice changed the feed, or the wind blew the antenna off its critical heading alignment. I'd be up there in the wind, ice, and rain trying to talk on a phone as we repointed them, or chipped ice. Only then did I cuss wireless :-)

I'm thinking of putting up my dish on a rotator, and hook it to the amp, and then swing it around to use my neighbors wireless access point, which is in its linksys default setting :-)
It will save me $40 a month...

In article <as2vlt$8es$1@news.tamu.edu>, wej3715@fox.tamu.edu says...

<snip>

> I guess what confuses me is that there seems to be quite a few hams who use it for personal, non-pecuniary, reasons that have nothing to do with learning the art and science of radio communications.

I won't deny that there's quite a number of "Appliance Operators" Out There. That, however, does not change the guiding principles of ham radio. It remains today, as it always has been, a mostly tech-oriented hobby. Witness the technical content of the license exams.

Like many other things, you get out of ham radio exactly what you put into it. There are many hams who get their license simply to have a clear and (reasonably) long-distance form of communication outside of the CB arena.

While it is my personal view that such people would be better off with CB, the FRS, or perhaps GMRS, there is no law that says someone has to be a pure tech to get their ham license. You merely need to learn enough to pass the exam.

HOWEVER -- With that said, you're not going to get very much out of the hobby if you just want to use a radio without getting darned curious about what goes on inside its guts, and finding ways to improve on that WITHIN THE BOUNDS of FCC Part 97.

There's a repeater here in western WA, belonging to the Mike & Key ARC, which frequently has highly technical discussions go on over the air. Such discussions will usually glaze the eyes of an "appliance" operator within seconds, but they really have no one but themselves to blame.

I'll say it again. This is a technical hobby. The more you choose to teach yourself about radio guts, and the various circuit theories and practice that go along with them, the more you'll get out of it and the more you'll be able to give back to the hobby.

> It would seem to me that in this age, doing things with
> digital communications would fall more into the art and

http://www.aprs.org

Need I say more? ;-)

> I figured the wardrivers would be over in the unlicensed
> bands. In any event, I live well away from any likely
> war drivers of any description.

A very dangerous assumption on both counts. Wardriving is still fairly popular, and wireless nodes ANYwhere will, eventually, attract wardrivers. It's a Murphy switch.

> Nonsense. You have to know what you're doing and use appropriate
> methods to control your security.

True, but the encryption methods of 802.11b are hopelessly weak. Tools such as Airsnort, and Lord only knows how many 'cracking' programs, can make short work of any wireless LAN.

Even basic DES encryption at the hardware level would make for a much more secure environment. Unfortunately, it also adds cost and some degree of complexity to the hardware involved. This means that the Joe Consumer PeeCee crowd is most unlikely to want anything to do with it.

"Plug-and-Play" has its disadvantages.

I doubt that the FCC will find it necessary/desirable to actually write any new rules. The current rule holding the operator of the gateway responsible for the traffic it puts on the amateur service is probably sufficient. BTW, it is not necessary that all traffic across the gateway be between hams. Obviously, the gateway can pass information to non-hams on the outside. I would expect that the normal rules for third-party traffic would apply.

It all works pretty well with traffic originating "inside" the gateway. Obviously, no ham will generate traffic that violates FCC restrictions :-). The different types of gateways differ in their policies toward traffic originating "outside" the gateway. One of my favorites (and the sort of thing that is encouraging me to upgrade my license) is the WinLink 2000 project (www.winlink.org). Briefly, they use the HF bands to carry email and APRS traffic that this then gatewayed to/from the Internet. They do allow traffic from non-hams to cross the gateway, and other than a few spam/blacklist filters, rely on the control operators at the gateway and the recipients inside the radio network to police content.

>of these were on the ham bands.
>

Prudence would say that all 802.11 networks (even at home) that are using current version of WEP be placed "outside" the VPN'ed home network. For this very reason, I maintain a DMZ at home for my 802.11 networks. Back when I had a VPN in to various corporate networks, I considered this a minimum requirement to meet my "moral" obligations per the corporate AUP. (Plus, it would have been embarrassing for the Chief Network Architect's DSL link to be use as a wormhole for a hacker :-)) These day cheap firewall boxes that allow such a function are easily available.

Practically speaking however, most enterprises don't try to police the home use of wireless, so they either don't trust any external link (and use appropriate authenticated protocols such as POP/IPMAP and SSH), or they allow VPN tunnels only to an individual desktop machine (with IP forwarding turned off for the forwarded packets). And even at that, they filter the VPN traffic for obvious intrusions and AUP violations.

Now all this being said, why do you consider VPN to be the only way to access university services? Most universities that I am aware of make key services available outside the firewall to authenticated users (e.g, POP/IMAP, SSH, HTTP authentication of various types). E.g., my wife is a professor at a local medical school. She is able to get to all important services (her email, PubMED, the university library catalog) from our home network without a VPN.   On my home network, I use authenticated WebDAV to export various internal file systems to the Internet when I am traveling.

But that being said, it is easy to design/deploy a VPN protocol that does not encrypt the traffic and meets FCC amateur service requirements, but only allows traffic from authenticated users. Something on the order of IPSEC using just the Authentication Header is probably just right.   Obviously, the AH-protected tunnel should extend between the remote end of the wireless link to some point within the trusted scope of the university network.

[snipped discussion of FCC acceptable use...]

>What are those restrictions? I've seen some, but I imagine there
>are some that I don't know of.
>

This is not an area of pure black and white.   The idea is that to further the cause of amateur radio, certain non-amateur traffic is allowed (as someone else said, you need something to talk about :-)). So lighting will not strike if you order a pizza, send email to your brother, or occasionally browse CNN.   It hinges on intent.   If you are just trying to use the ham bands in lieu of commercial services, then that is a violation of the intent.

The problem is that intent is hard to prove. From a practical standpoint, the FCC is not going to bother with enforcement except in cases where the intent is easy to determine (e.g., obvious commercial traffic), or were a possible attempt to conceal intent is happening (e.g., encryption).

It is probably true that some of the traffic on the 2m repeaters is sent with the intent to violate the restrictions (Gasp...).   So you will see actual usage scenarios that probably violate the spirit of FCC regulations. Generally, hams relay on social mechanisms to keep this under control.

IMHO, limited universtiy-related traffic is probably ok, as long as that was not your primary reason for deploying the link, and you, as the control operator, are not getting paid for the traffic.   I would think the fact that YOU are probably paying the university is similar to the ordering pizza scenario. (But if you are a teaching assistant, and you send/recieve course material for the course you are TAing, that would be a violation)

Don Hoffman

In article <as3agp$huc$1@news.tamu.edu>, wej3715@fox.tamu.edu says...

> Quite well, actually. It's based on math and I have two math
> degrees from the 70's.

Congratulations on mastering much in the theoretical realm. Practice is frequently a very different can o'worms.

> How much real experimentation is actually done on amateur
> radio these days? (By that, I mean innovation, not just
> implementing something already developed elsewhere.) At

Innovation's a bit of a catch-phrase. Better to look at things as pure research (testing the limits of a new theory), or applied research (finding things you can do with existing technology, and pushing its limits as well).

There's plenty of both in the ham field. http://www.amsat.org is one good example where both would be applied.

> I think it would be logical to try to encourage innovation
> and experimentation rather than to just sit back and talk
> to each other in more or less the same way as was done

> decades ago. There ought to be plenty of opportunity for
> both.

You're missing the point. There's plenty of room both for just "talking to each other" and for experimentation. And all degrees in between. As I said in an earlier post, you get back from the hobby exactly what you put into it. Ham radio is a great mirror.

If you think you want to try and push the boundaries, then get your license and start doing it! AMSAT started out as a few hams getting together and saying "Hey, I think we can do this."

> From the outside looking in, it doesn't really appear like
> packet has really done much in the last ten years or so,

<snip>

If it works, don't fix it. ;-)

> Then a few months ago, I read a little bit about packet
> today and it doesn't seem like it has really progressed
> very far. I was a bit disappointed.

Then get your frelling license, and try to DO SOMETHING about it! Simply thumbing your nose with an "I'm a bit disappointed" does nothing. Who knows? You may turn out to be one of the movers/shakers of the field if you put your mind to it. ;-)

> Am I wrong about that? Is there a whole lot going on
> that I just don't see since I'm just a casual observer?

Very likely. Lord only knows what could be going on in some ham's garage even as I type this.

Keep the peace(es).

Yes, it did allow commercial traffic. The whole idea of getting just outside the ham bands was to avoid the problems with trying to do certain things inside the ham bands. We described everything we wanted to do in detail to the FCC and they approved it. I have since seen many many other experimental licenses issued for various ideas. It would solve all the issues that are being discussed in this thread..

Thanks. That is a great idea, especially for some things I'd like to do
involving robotics.

: > from the library is not a ham radio hobby activity. But then I
: > wouldn't think that using a phone patch to call your wife to tell
: > her you'll be home in 5 minutes would be a hobby either.
:
: The key to these exceptions is whether you are trying to avoid using regular
: commercial services. For example, if calling your wife is long distance
: over phone from your present location or is chargeable minutes on your cell
: phone but is a free call via the phone patch, then it is against the rules.
: Or if you do it all the time, it might be against the rules.

That could be a question on autopatch where I live. It's a long
distance call to my nearest neighbors 1/2 mile away using regular
telephones.

: On the other

: hand, if it is only occasional, it will generally fall within the rules.
: Afterall you do need to use the phone patches once in a while just to be
: familiar with their use in case it ever is necessary to use it. Practice in
: the form of occasional use would be within the realm of the hobby.

How about the fact that it is difficult to determine if you need to improve something, why improvements might be useful, where to look for potential improvements, ..., if you aren't allowed to use it. Plus, if you go to all that trouble and are successful in making the improvements, but can then never make use of what you did, very few would ever even bother.

: An issue here is that this service is available by regular commercial means
: (i.e. a commercial ISP). If using the radio service to tie into the
: university avoids paying ISP fees then it would probably not be permissible,
: at least not on a regular basis.

In my case, the link would be to the ISP and travel over regular Internet from there. However, while not the purpose for doing it, it would save long distance charges to connect to that ISP. (There is another ISP who is a local call, but I prefer the first.)

My interest is not based on saving money. While money is an issue, I think the costs would be significantly higher than using dialup. If it were to save money, a dialup connection would be the clear way to go.

And the license-free wireless connection is certainly a viable approach.

My reasons for considering the amateur radio approach include an interest in a more hands-on approach, a better potential for making at least some improvements if I need (which may never happen), and to gain more experience with radios that may be useful for my main intests such as for communications between autonomous robots.

But I have to justify it somehow, at leat in my mind. And this seemed (note past tense) like a reasonable way to do just that. I could perhaps justify the higher costs as very worthwhile education and practical radio experience.

: >ham radio connections to the Internet. Do the ham radio
: >gateways generally authenticate their users or do they
: >assume that anyone accessing them is a licensed amateur
: >operator?
:
: I doubt that the FCC will find it necessary/desirable to actually
: write any new rules.   The current rule holding the operator of the
: gateway responsible for the traffic it puts on the amateur service is
: probably sufficient.   BTW, it is not necessary that all traffic
: across the gateway be between hams.   Obviously, the gateway can pass
: information to non-hams on the outside.   I would expect that the
: normal rules for third-party traffic would apply.
:
: It all works pretty well with traffic originating "inside" the
: gateway.   Obviously, no ham will generate traffic that violates FCC
: restrictions :-).   The different types of gateways differ in their
: policies toward traffic originating "outside" the gateway.   One of
: my favorites (and the sort of thing that is encouraging me to upgrade
: my license) is the WinLink 2000 project (www.winlink.org).   Briefly,
: they use the HF bands to carry email and APRS traffic that this then
: gatewayed to/from the Internet.   They do allow traffic from non-hams
: to cross the gateway, and other than a few spam/blacklist filters,
: rely on the control operators at the gateway and the recipients inside
: the radio network to police content.

Some of the emphasis on the National Strategy To Secure Cyberspace is on making it much more difficult for people to break into someone else's computers and then make use of them in an attack. If the amateur radio side has little security, then they might need to be tighted a bit.

: >In the cae of A&M, opening up the network itself in a manner
: >which permits people who are not authorized to use the network
: >is certainly prohibited by university rules. However, I haven't

: >are a number of vulnerable openings directly into the university
: >network that are accessible by wireless. I'd be surprised if any
: >of these were on the ham bands.
: >
:
: Prudence would say that all 802.11 networks (even at home) that are
: using current version of WEP be placed "outside" the VPN'ed home
: network. For this very reason, I maintain a DMZ at home for my 802.11
: networks.   Back when I had a VPN in to various corporate networks, I
: considered this a minimum requirement to meet my "moral" obligations
: per the corporate AUP. (Plus, it would have been embarrassing for the
: Chief Network Architect's DSL link to be use as a wormhole for a
: hacker :-))

I was rather embarrased the one time I got a computer virus. I was leaving to go to the medical library (thE best place at A&M for uninterrupted study) and checked my e-mail on the way out the door. One of the e-mails contained a virus and I opened the attachment. Fortunately, I was running a software fireall on the machine (Zone Alarm) and caught it the first time it tried to phone home.

Now I check my e-mail only from a computer running OpenBSD since there are, to the best of my knowledge, no e-mail viruses that have any effect on OpenBSD.

: These day cheap firewall boxes that allow such a function
: are easily available.

I have one. It's not real impressive, but it does a serviceable job.

: Now all this being said, why do you consider VPN to be the only way to
: access university services?

I don't. Actually, I use SSH as well. But SSH only takes you to a couple of machines. I believe that using those machines as a relay to other machines inside the network is somewhat frowned upon, but I've never heard of anyone being hassled for doing it. Four or five years ago, those machines were used very heavily, but now days with all the Windows machines in the labs, they are often underutilized. It is probable that the machines you can connect to from outside using SSH may rarely have more than three or four active users at any one time now days.

: IMHO, limited universtiy-related traffic is probably ok, as long as
: that was not your primary reason for deploying the link, and you, as
: the control operator, are not getting paid for the traffic.   I would
: think the fact that YOU are probably paying the university is similar
: to the ordering pizza scenario. (But if you are a teaching assistant,
: and you send/recieve course material for the course you are TAing,
: that would be a violation)

That's kind of what I figured. I was a TA, but that was back in the 70's and ended in 1980, so that part is not a problem.

I remember you description; you were ahead of the curve.
RangeLan h/w was expensive and the wireless LAN industry
simply wasn't a consumer item yet.

Now it is.

> Once Cox wired up everyone for cable modems, the thrill

Well, shared 11mb/s is about $200/node now with a hub
access point around $800. Certainly, if you have
broadband available, it's not terribly compelling,
but some of us live where there isn't broadband.

> Even now I get requests to give away my old equipment,

Heh. You were an innovator, Steve!! Now it's off the
shelf stuff, and you couldn't interest me in the 70kbytes/sec
performance of old Proxim stuff. Even Proxim figured it
out and bought Orinoco...

;-)

APRS is basically the Navy TADIL-A system without a
net control station. Designed in the late 40's, and still used
to day, although TADIL-J (JTIDS) at L-Band is finally
starting to become usable.

Well my success was due to the neat driver written for Linux
that allowed me to setup cheap routers. Then when the bridges
came down to $350 (a steal, ha) for 500 mW it made the
linux box obsolete. Shoot, now for that kind of money you
could wire-up the whole town, hee. Of course the DS spread

spectrum is a better deal also.

My problem, was our ISP was two wireless hops away, and
no good sites at the midpoint, and then my ISDN charges
went through the roof, since all ISDN is a business line, and
subject to the Gore tax.

Yea, Proxim is a neat company. If the competition builds
something better, they will buy them out...

Actually, with the GPS technology around, there's little difference. If I were to activate my mobile's APRS beacon right now, the location would show up within the hour at findu.com, with my exact position and status. Tracking aircraft is easier only because of radar systems, and the fact that said systems have been in place since the 40's.

Like I said; If you're not keen on the "innovation" happening in ham radio at the moment, you are cordially invited to get your license and DO SOMETHING about it. ;-)

That's a good sentiment, Bruce, but in this guy's case I think the best thing he can do is to take a hike. He's a user, out to get what he can for himself and to hell with everyone else. Not really Ham material.

Charles,

From your posts on this thread it is very clear that your approach
to a discussion is to belittle others, to misrepresent their words
completely, to stereotype people based on your own whims, and to
ignore what they really said for your personal convenience.

You had one post in this thread that was worth reading. The
rest have been a waste of time.

Fortunately, many newsreaders can be set to filter your tiresome
and useless posts.

Adios.

Eric Johnson

Hi,

I have a TAPR Motorola EVM56002 Radio Interface for sale. It includes
the EVM56002, is assembled, and passes the basic checkout. $225
shipped UPS CONUS.

Basically, I just haven't needed it, and am doing some serious shack
cleaning. Please contact me off list.

Alan
WA4SCA@AMSAT.ORG

NASA has two projects:

Shuttle exists to service Space Station.
Space Station exists to provide missions for Shuttle.
On these two hang all the law and the profits.

Actually, there's little skin paint radar anymore; it is mostly throught the transponders.

And VFR is 1200 unless "otherwise directed".

How do they handle aircraft with transponders that don't report their position? Can they get the direction of the aircraft from the response and the distance by time of flight?

About 1982 or 1983, I tried to get some people interested in working to develop a display for aircraft that would use Loran to determine the position and display an aviation map to the pilot with his position indicated. The display would use a CD to hold the necessary aviation charts. The usual reaction was that it was an interesting idea, but noone wanted to pursue it.

The ground antennas are directional and rotate just like radar; when you
have a co-located skin paint radar, the two antennas are mounted together.

You get azimuth from the antenna position.

The response times of transponders are specified. You get range from
from the time it takes the transponder to respond; i.e. 150 meters/microsecond
minus fixed hardware response time.

You get altitude from a mode C equipped transponder (most are these days)
by some bits in the response that indicate altitude.

Too bad. Those things were popular for a while (yes, someone did it), but
these days most people go for GPS as GPS has better coverage. The maps
are in memory like digital cameras, not CDs.

For a reality check of what you can get in just a hand held aviation
GPS, look up the specs on the Garmin GPSMAP 196.

The lat/lon of the radar site is known, and thus the bearing and range of the aircraft is determined, and can be converted to lat/lon for track processing and database entry. The old transponders basically give a 4 digit octal code, and altitude, while the Mode-S gives just about everything (N-Number, air pressure in the left main tire, etc--OK, I'm kidding, but it has a lot of poop transmitted) and can be interrogated specifically, rather than a sweeping 360 degrees like the old stuff.

Non-Mode-S transponders basically reply to interrogations during the antenna sweep through the aircraft azimuth. This generates about 100 replies, and the centroid of the replies is declared the target azimuth. Most radar interrogaters now are equipped with monopulse receivers and can determine azimuth to a degree or so. Even the big AWACS jet has converted over to monopulse and Mode-S capable interrogators.

Every pilot now has a GPS with a map that can clip to the yoke, or if the plane is big enough, like an airline, they have a glass display that integrates GPS position with waypoints, heading, and in some cases weather radar data.

A pilot friend of mine commented that he used to fly from OKC to Pueblo and just get a few hits from radars during the flight. Then when TCAS came out, he said the damn transponder was smoking from continuous interrogations from airlines and radar sites. He didn't think it was going to hold up, and sure enough it failed, so he got a modern one that limited the duty cycle, and could handle heavy use with a big heat sink on the back.

Our problem at the time was that memory was rather expensive. Not long before that, the engineering company I was at spent about $10,000 for a little less than a megabyte of memory for the PDP 11/70.

On the other hand, all I knew about CDs at that time came from

technical journals and other articles. Noone I knew had ever
seen one yet, but it was the only thing I could think of at
the time with sufficient capacity.

Does anyone make a GPS receiver that also picks up GLONASS (however
it is spelled)? I've always wondered if the Russian system has
the same introduced errors as GPS.
Eric Johnson

No idea.

The "introduced errors" were turned off years ago.

I didn't know that. The errors in the few units I've seen made
me think they were still turned on.

<WARNING: Shameless Plug Alert>

Yes, I do. I have the cable as well, and I would be happy to program that R-100 for you. I think my rates would be just a bit lower than most commercial shops. ;-)

See http://www.bluefeathertech.com/rf.html for details.

BTW, please don't ask for a copy of the software. You should have seen the licensing agreement I had to sign just to get it!

Wow. I can't believe it. You guys should put 5.0 gigahertz
802b stuff on top. You can run a high speed packet using
commercial hardware on the cheap. You would get very good
range with it too. Someone mentioned it another thread.
I was thinking about doing something of that nature and I was
plotting out paths in my area.

Although that suggestion is "good" for what it means, you are apparently
```

clueless as to the equipment and specifics.

802.11b is on 2.4GHz, and is cheaper that the 802.11a 5Ghz stuff, of which only the part of the equipment at 5.7GHz will be of value (i.e. sufficient power). The 802.11a stuff at 5.2GHz lacks sufficient power for significant distances. Furthermore, 802.11b is currently about 1/3 the price of the 802.11a stuff.

Try reading up on 47 CFR 15.247 and 15.401 ff. as far as limitations go (while keeping it within part 15). [Of course, if one wants to exceed those limits, then licensed amateurs are free to do so, but within any part 97 restrictions.]

See also the recent post I made, commenting on the 72 mile wireless link using 802.11b equipment on "alt.internet.wireless."

Hi,
Hope everyone had a Great Turkey day!
I have Hr A TC-70-1 ATV Transceiver 1 watt & 30 watt Alinco Amplifier...
No Activity in my area? so need to sell or Trade for ?

sell $300.00 Shipped
in lower 48

73 Larry

Correct.

> I'm curious about what happens if you want to connect
> to a machine that only allows encrypted connections
> such as ssh or a VPN.

You would have to use a Part-15 device, such as a spread spectrum wireless card. The secure link would be prohibited in the Part-97 ham bands.

Not to mention, the school probably would consider it outside the legal use of their network.

> What's the status on that? Are there any exceptions
> for cases when you really can't get around it?

No exceptions, can't get around it. Amateur Radio is strictly a hobby, and anything that would make it into a viable business utility, or a way of selling services, would be outside the scope of permissible communications.

What you could probably do, is use Amateur Radio as a component of your graduate studies. Possibly an RF link for data communications (not encrypted), data logging, etc.

Two issue exist here:

1. Encryption of data
2. Commercial use

Issue 1 is clear cut all traffic on the Ham Bands has to be plain view, this is a violation.
Issue 2 is interpretive, judging how Mr. Hollowingsworth (FCC Lawyer and Chief Enforcer of Regs in case you did not know) is issuing violation notices lately, he would probably issue one on this and then review. College

communication after all is not for the public good but for the good of one
person.

Just food for thought

You mean that accessing a research journal while working on your
PhD is classified as "commercial use"?

I never would have expected that.

There is a fairly wide leeway for students. You obviously can't use the school's network for commercial purposes.

But because of security concerns, unencrypted connections are frowned upon. You can use telnet but you must use a set of one time passwords. And there are very few computers you can access via telnet from outside the firewall.

To go through the firewall and have regular access, you have to use VPN and all that traffic is encrypted.

The high-schools are turning out way to many semi-literate people into the
colleges. The point about encyrption kind of "whizzed right over his head".

The guy is looking for loopholes, is dissapointed that he didn't get one.
Just the kind of guy we need in Ham Radio, right?

He'd be a real ASSet to the hobby, I'm sure.

Not a good Amateur Radio application. Consider using Ham
Radio, AFTER it get's to your desk, and after the VPN. This would
be legal, if the University approves.

For example, using your VPN connection to upload/download
APRS traffic would be acceptable. Things like that, where the
Internet is merely a tunnel.

Over a VPN, yes. It isn't considered open communication with
other Amateurs, or experimental in nature.

We're not just talking about commercial purposes. Ham radio operation also prohibits foul language and music. This effectively prohibits the use of many, if not most newsgroups. Ultimately, ham radio operation will also require the presence of a control operator who reviews all traffic. This means that someone is required to MONITOR EVERY PIECE OF TRAFFIC being sent.

Amateur radio is about learning the art and science of radio communications. Your computer network notions are NOT what ham radio is for.

If you try and get cute by pretending you're a ham and jacking up the power, WATCH OUT. If the hams don't find you, the wardrivers will. You'd better hope that ham radio enthusiasts find you first, because all they'll want to do is get you off the air. The wardrivers will probably find new and creative ways of screwing up not only your wireless infrastructure, but everything else as well.

>But because of security concerns, unencrypted connections

>are frowned upon. You can use telnet but you must use a

If you have security concerns, you shouldn't be using radio at all. ArsTechnica had a "Black Paper" about a month ago concerning 802.11b vulnerabilities. It turns out that even if security is turned on, you may not be as protected as you think you are.

>To go through the firewall and have regular access, you have
>to use VPN and all that traffic is encrypted.

Too bad. Use the unlicensed 802.11b and 802.11a stuff if you think you must use radio. I know you are probably chafing at the limited range and bandwidth of these modes. Welcome to the reality of radio. None of us, except perhaps television broadcasters, have the bandwidth and power to do what we really want.

Maybe now you'll consider that the possibility of wiring the campus with fiber isn't as outrageous as it first seems.

I think a free SSTV program and a sound card is needed.

"Dorian Creber" <Dorian.Creber@n.o.s.p.a.m.camfordpress.co.uk> wrote in news:3de4d06a$0$4783$fa0fcedb@lovejoy.zen.co.uk:

That is correct.
"Encrypt" in part 97 et al means "... to hide the content".

> I'm curious about what happens if you want to connect
> to a machine that only allows encrypted connections
> such as ssh or a VPN.

You cannot do this over ham radio.

You cannot do that over ham radio.

> What's the status on that? Are there any exceptions
> for cases when you really can't get around it?

No. Connect to other hams instead of commercial hosts.
That's the whole point of ham radio.

Look here and get mmsstv.   A very good free program. There are also other free programs at that site for many other sound card modes. The mmrtty is good for rtty.

http://www.muenster.de/%7Ewelp/sb.htm

It is a sound card program. If you can not build a simple interface to get audio into and out of the sound card of your computer do a Google search for an interface called Rascal. Much cheaper than Rigblaster.

Go to 14.230 or 14.233 usb and tune in the guys talking about sstv if there are not any tones being sent. Usually if you are tuned into the voice , the same tuning will work for the sstv.

:
: Amateur radio is about learning the art and science of radio
: communications. Your computer network notions are NOT what ham radio
: is for.

I guess what confuses me is that there seems to be quite a
few hams who use it for personal, non-pecuniary, reasons
that have nothing to do with learning the art and science
of radio communications.

It would seem to me that in this age, doing things with
digital communications would fall more into the art and
science than many other uses.

: If you try and get cute by pretending you're a ham and jacking up the
: power, WATCH OUT. If the hams don't find you, the wardrivers will.

I figured the wardrivers would be over in the unlicensed
bands. In any event, I live well away from any likely
war drivers of any description.

: If you have security concerns, you shouldn't be using radio at all.

Nonsense. You have to know what you're doing and use appropriate
methods to control your security.

Too many people just set up a unlicensed network out of the box
and think they are safe.

: Maybe now you'll consider that the possibility of wiring the campus
: with fiber isn't as outrageous as it first seems.

A&M is rather well wired, but they are using radio, too. But the
radio setup typically requires you to use the VPN for any meaningful
access because of the poor security otherwise. In any event, I
live quite a ways from the campus and only go there when I absolutely
have to.

Good point.

From a book on becoming a ham that appears to come from the
ARRL and sold through Radio Shack:

> You can, however, use your Amateur Radio station to
> conduct your own personal communications.

...

> No one can use an amateur station for monetary gain.
> You must not accept payment in any form for the use
> of your station at any time. ... Payment means more
> than just money here. It refers to any type of

> compensation, which would include materials or services
> of any type.

It looks to me like it bans the use of ham radio to do anything for which you are paid in one form or another except for a couple of clear examples. You also can't use it on behalf of your company or employer.

And it sure doesn't limit you to communicating only with other hams. At leat, according to that publication.

What I fail to see is that doing something like accessing the library's on-line card catalog or reading a research journal has anything to do with pecuniary interest. I sure don't get paid to see what books are available or to read the journals.

The fact that you might be accessing some kind of material or service wouldn't seem to imply that you are getting paid in the form of that material or service in exchange for using the radio.

Is the chance that you might graduate some time in the fugure and the chance that you might get a job using your degree enough to make it a pecuniary interest?

The fact that they are using it for enjoyment is not the issue. Ham
radio is basically meant to be a few chunks of spectrum where people
can play with the technology in the open.

>It would seem to me that in this age, doing things with

No disagreement there. There are lots of really cool digital
communications methods on the air. Most of them are very slow. Few
run at speeds greater than 56 kBPS.

>: If you have security concerns, you shouldn't be using radio at all.
>
>Nonsense. You have to know what you're doing and use appropriate

There is an old maxim about radio: Don't say anything you wouldn't
want to see published in the next morning's newspaper. How well do
you REALLY understand the security you're using?

>Too many people just set up a unlicensed network out of the box
>and think they are safe.

Too many people set up those unlicensed networks, enabling the
security very carefully and they're still not safe. Read
ARSTechnica's Black Paper. It's an eye-opener.

>: Maybe now you'll consider that the possibility of wiring the campus

>have to.

Look, I have a feeling that we're talking past each other. Let me
reiterate: This "no encryption" thing isn't just common practice or a

gentlemen's agreement. It's a hard and fast regulation straight from the Federal Communications Commission.

You don't have to take my word for it, here's a link straight from the Government Printing Office:

http://frwebgate.access.gpo.gov/cgi-bin/get-cfr.cgi?TITLE=47&PART=97&SECTION=113&YEAR=2001&TYPE=TEXT

It's 47CFR97.113(a)(4). Read it carefully. Note the prohibition against "messages in codes or ciphers intended to obscure the meaning thereof". How does a VPN *NOT* fit this definition?

I'm sorry to be the one to burst your bubble, but ham radio is not for folks to extend networks to their homes using VPNs over the air.

73,

Steve, K5OKC (k5okc@nojunk.cox.net) wrote:
: Not a good Amateur Radio application. Consider using Ham
: Radio, AFTER it get's to your desk, and after the VPN. This would
: be legal, if the University approves.

I thought about that. The problem is that it becomes a criminal violation of state law if anyone not authorized to connect did connect to the same computers. Even if they are authorized, I don't believe that they are allowed to use someone else's

VPN connection with the possible exception in the case of roommates.

Admittedly, there are occasional violations of those rules. For example, I've heard of students letting their spouses use their e-mail accounts.

So if I were to do that and someone else inadvertently or purposely used the VPN connection to connect to A&M's computer system, it would be a violation of the Texas Penal Code since they lack the proper permission.

Admittedly, it is doubtful that there would be any prosecution unless they caused some kind of damage, but it could still happen.

While I don't know that it would be a criminal act on the part of the person who set up the VPN, there would probably still be school sanctions of some kind as a result of allowing an unsecure connection to exist. At the very least, I would expect someone to lose their Texas A&M computing privileges.

So for the connection, it would either have to be VPN all the way or not at all. Therefore, it would obviously have to be not at all because of the prohibition on encryption.

It would be an interesting idea. It might be possible to set up the computer with the local side of the VPN connection so that it would filter out the inadvertent, nonauthorized traffic. But it would still be vulnerable to malicous attackers since they would be able to examine the authorized packets and spoof them.

Where I live (I have a 1200 mile round trip commute) there are few, if any, people who have a mindset to break in and who have sufficient skill to do so. So some kind of security filtering to keep the accidental traffic out of the VPN might work fine, but I don't think it would be approved.

Note.   I'm not saying I want a 600 mile radio link. Just a 20 mile link from the farm to the nearest town and then use regular internet connection from there.

For what it's worth, I think what I'd like to do is far more expensive than what I would be happy with since I'd probably have to put an enormous effort into developing a radio link that is fast enough that I could run programs on computers at A&M and display the data at home or to have reasonable access speeds when reading the research journals from the library. In any event, I might have my doctorate by the time I got it up and running.

On the other hand, once you start trying, sometimes things
end up less expensive and faster than they appeared.

Probably.
But that does not matter.
You cannot encrypt communications that use Ham Radio.
End of story.

Outside of all that has been mentioned, what would one call the transmitter/receiver at the school's end ? It does not seem to be a repeater or remote base.

There is some limited telnet access using one time passwords.
That would be in the clear.

Then the pecuniary interest question would remain.  Would
that still be prohibited for the reason that you might
eventually earn a doctorate?

That's fine. I just wanted to ask to be sure.

: I'm sorry to be the one to burst your bubble, but ham radio is not for
: folks to extend networks to their homes using VPNs over the air.

I thought ham radio was for experimentation and education. It
would seem that in some cases, absent the explicit ban in
47CFR97.113(a)(4), it could indeed fall well within those
purposes.

How much real experimentation is actually done on amateur
radio these days? (By that, I mean innovation, not just
implementing something already developed elsewhere.) At
one time, things like bouncing a signal off of a satellite

or the moon were quite innovative and experimental.

I think it would be logical to try to encourage innovation and experimentation rather than to just sit back and talk to each other in more or less the same way as was done decades ago. There ought to be plenty of opportunity for both.

From the outside looking in, it doesn't really appear like packet has really done much in the last ten years or so, but I might be wrong. In the late 80's I was intrigued by the idea of packet, but I was head of R&D for a small company that couldn't afford to pay me more than my basic living expenses and so I couldn't afford to do much. Then a few months ago, I read a little bit about packet today and it doesn't seem like it has really progressed very far. I was a bit disappointed.

In contrast, there seems to be plenty of experimentation and innovation on the unlicensed part 15 bands. That should increase some more with the recent relaxation in a few of the rules.

Am I wrong about that? Is there a whole lot going on that I just don't see since I'm just a casual observer?

Eric Johnson

HOws this one. You want to live in a condo 20 stories high, so you ask the bldg manager if you bought a condo near the top of the bldg would he allow you to install a rotary beam on the roof! Tell him you would use your ham radio as an emergency assistance means of comms in case of any kind of an emergency even includeing various parts of the BLDG.   This is a a conditional purchase to be true about it, and your ham radio is gaining you a permit to put your beam up on the roof.   Is their any conflict there? I dont think so as long as the Apt didnt have any added cost put into the price just because of your ham radio requirements.

We have several about 6 of these on high rise bldgs here in Honolulu and Waikiki that managed to get these deals through, and to my knowledge none have had any problem with the bldg managers, nor FCC rules.

Joe/KH6JF

It's allowed by the rules, while a VPN is not. The thing to remember, is that Ham radio is a hobby. If you use it for a private network that is encrypted, how could this benefit society? I'm not saying everything that Hams do now benefits society, but that is the goal.

While you could be doing your homework, you could also be going to pay for service web sites (porn, gambling, and credit card transaction. It's encrypted, and no one knows what you're doing. The person calling his wife on the patch is not hiding anything, and anyone can key up and say hello to his wife.

Actually, I was addressing the question of whether or not
it was pecuiary in nature, not the VPN question.

: The thing

: to remember, is that Ham radio is a hobby. If you use it
: for a private network that is encrypted, how could this
: benefit society?

I suspect most hams did not become hams in order to benefit society.

: I'm not saying everything that Hams do
: now benefits society, but that is the goal.
:
: While you could be doing your homework, you could also

What homework? I'm doing research hours only right now.

: be going to pay for service web sites (porn, gambling, and
: credit card transaction. It's encrypted, and no one knows
: what you're doing. The person calling his wife on the patch
: is not hiding anything, and anyone can key up and say hello
: to his wife.

I wouldn't have to connect through the A&M firewall for those.

I do occasionally order something from the Internet such as computer equipment and books. I hadn't thought of buying computer equipment and books as a potential violation. But I readily concede that most sites switch from http to https for the purchase and so that would be a violation on that issue. The transaction itself doesn't seem all that much worse than making reseervations at a restraunt over a phone patch, but I'm sure it is a violation in and of itself.

But I could always drive to my brother's office for purchases.

Are the rules interpreted so as to prohibit you from accessing any site on the Internet that you paid for the right to access? If that's the case, you'd be stuck with the free e-mail services.

That does bring up a good point (I think). If a ham operator checks his e-mail through an amateur radio connection and one of the e-mails is an unsolicited and unwarranted porn spam, does that put him in violation? If that's the case, I'd guess that most of the hams checking their e-mail that way would be in violation.

I think I've definitely decided to not bother with amateur radio based on this thread. There just doesn't seem to be any point to it at all.

I don't have time to waste on a hobby that I cannot legally benefit from in any way at all except in the case of an emergency.

I don't see anything wrong with personally benefitting from
a hobby (that doesn't mean by selling services or something).
On an average day, I get five to ten porn spams in my e-mail
so I wouldn't be able to check my e-mail. I need to be able
to securely access the computer networks at A&M. That's
completely out. I can't even connect to a web site and order
a radio to use for communication.

Why bother?

Eric Johnson

Good thinking!  Now buzz off. Ham Radio most definately doesn't need you
either, so it looks like a good deal, all around.

You might want to watch your mouth, by the way. It can get you into more
trouble that you can handle.

For what it's worth, you're the one who started calling names. I merely responded in kind.

All I had was a simple couple of questions. I was pretty sure I already knew the answers, but I wanted to ask in a forum where I figured I might get a reasonable answer and a discussion about them, if necessary. But instead, what do I find but a smartalec like you.

I can see why ham radio is having trouble attracting new blood. Instead of answering an honest question honestly, jerks like you just start badmouthing them from the start.

In fact, from your first response on, you appear to be the biggest jerk I've ever met who has a radio license. The vast majority of the hams I've met usually enjoy answering questions. There have been exceptions, of course, but you are the champion exception of all time.

So what's your problem?

Eric Johnson

By that I meant using the billions of dollars in spectrum for non-commercial, non-private communications.

I think your problem here, is thinking of ham radio as a way of extending the Internet. They are two separate mediums. Ham radio has nothing to do with the Internet, although wireless devices could be used as you suggest, that's not what the billions in spectrum is for. It's for radio communications with other like countries, using modes that Hams design or adopt.

> That does bring up a good point (I think). If a ham operator

Yes.

It would be a bad way of using the gift of billions in spectrum value.

> I think I've definitely decided to not bother with amateur

Let me put it this way, the first time I talked to Sweden on 10 meters, in my car coming home from work, was much more exciting than using the Internet. Therein lies the difference of what we each consider fun. Talking with other hams, using various modulation methods is what the service was designed for.

> I don't have time to waste on a hobby that I cannot legally

Fair enough. The feelings would be mutual.

Ham radio is about "we" not "me." Put it in terms of many foreign countries, rather than your nearest 100 acres. Amateur Radio is a global hobby, not something to waste on an Internet connection. If that is all it was good for, the government would sell it all off to the communications companies, and be done with it.

>
> So what's your problem?
>

You are by no means the first college student to get the bright idea that Ham Radio is the answer to their Internet connectivity problems. Since folks like yourself are swimming around in the university environment, the rules and laws that protect and define this hobby are always seen as an unreasonable inconvenience, something to try to "get around"... Some of them even end up butting heads with the laws of physics!

All of them end up being bitter when reality soaks in, and we get to see a few variations on the basic temper tantrum. Almost all of them eventually end up bad mouthing the hobby, which is strange because they seldom show any genuine interest in the hobby itself. - They're just looking for a freebee, an easy out, or an alternative to knowing what they are doing in the IT field, and doing it right.

My theory is that there is a misleading Linux FAQ or doc somewhere that keeps steering people the wrong way, otherwise this situation would not be so tiresomely familiar.

Whatever the cause, the end result is a lot of time and bandwidth wasted here, explaining the same information over and over to people who are supposed to know how to find out things for themselves. Then they get arrogant and nasty when they are told that they are not exempted from the rules. It gets real old, real fast.

Ham Radio has a lot to offer - if your primary interest is radio. If your main interest is not radio, then of course Ham Radio may not be relevant to those interests. That's the situation the FCC's PART97 rules are there to ensure when they define the hobby. Without those rules, this great hobby would soon cease to exist. Persons like yourself would gladly undermine the hobby in the cause of momentary expedience.

It's nothing personal, it's just that you are a carbon copy of several hundred other guys who got the same "bright" idea in the past, and had to have the hose turned on them so they'd quit humping around the yard. The whole situation is like - really old.

Tell you what: Hang out here and be the official guy who chases off IT students who have been led astray for a while. Watch yourself developing precisely the same attitude I have. Oh, you'll be all sweet and light at first, but give it a little time.. You'll see what I mean. Give it a little time, then imagine several years of it.

It gets like, really OLD, after a while. (yawn)

Charles, N5PVL

You did not like the answers you got, and indicated you were only interested in doing things that are not legal. Don't want you on the ham radio frequencies with that attitude. Come back when you learn what ham radio is about.

> I can see why ham radio is having trouble attracting new blood. Instead of answering an honest question honestly, jerks like you just start badmouthing them from the start.

You got the answer a dozen or so times. With a reading comprehension problem that severe, there is little chance you would be able to pass the license test anyway. Come back when you learn what ham radio is about.

> In fact, from your first response on, you appear to be the biggest jerk I've ever met who has a radio license.

Charles is not even close to taking that title.

> The vast majority of the hams I've met usually enjoy answering questions. There have been exceptions, of course, but you are the champion exception of all time.
>
> So what's your problem?

Instead of paying attention to the answers you received, you continued to argue and whine about how you want to do something you can't do. Life sucks. Get used to it. Go away now, and come back when you learn what ham radio is about.

That's not exactly true. I wanted to find out whether what
I am interested in doing is legal and what I have to do to
be legal, if possible. There is a big difference there.

: Don't want
: you on the ham radio frequencies with that attitude. Come back
: when you learn what ham radio is about.

And there is where the difference is. In fact, what
you do want is people to find out whether what they
want to do is legal instead of doing it anyway and
causing problems.

: > I can see why ham radio is having trouble attracting
: > new blood. Instead of answering an honest question
: > honestly, jerks like you just start badmouthing them

: back when you learn what ham radio is about.

Actually, some of the answers didn't make much sense.

: Instead of paying attention to the answers you received, you
: continued to argue and whine about how you want to do
: something you can't do. Life sucks. Get used to it. Go away
: now, and come back when you learn what ham radio is about.

Nope. I readily admitted the part about the encryption being a problem. I figured it would be when I posted the original message, but I wanted to explore it anyway.

That is, after all, how a scientific mind works. You not only ask questions you don't know the answer to -- you also ask those questions that you think you already know the answer. It's amazing how many times you find that there are things you missed. If you don't ask the question because you think you already know the answer, then you are likely to miss out on some things worth learning.

I was surprised by the assertion that accessing the university computers over a ham radio link involved pecuniary interest at all. If I was an employee of Texas A&M, then there would be a problem, but I just don't see that applies as a student. The last time I was an employee of Texas A&M was in 1980.

I'm still interested in why you and others seem to think that there is a pecuniary interest involved. A "yes there is" answer is not sufficient. Why is it involved? Do I misunderstand the notion of pecuniary interest? My understanding is that it involves being paid by someone else for using the link, whether in cash, pay check, benefits, ... When all I see is a "yes there is" type answer with nothing to support, I have to wonder if whoever is answering understood the question.

It's not whining to ask questions when you want to know the answers and the answers include reasons, not just an assertion.

But in the answers here, it seemed like the focus was on the quickly settled issue of encryption even to my specific questions about the rationale behind the assertions about the pecuniary interest. At first, I figured I must have not asked the question very well, but now I think that maybe the responses to later posts may have been written with the original post in mind.

In fact, you are a good example of that. Look at this:

I was specifically trying to understand why many on here seem
to think that there is a pecuniary interest problem here. But
instead of addresing the question, you just give a one word
rsponse of "probably" and then go back to the already settled
question (at least in my mind) about encryption.

I will spell it out again, very simply.
What you wish to do is not legal.
There is nothing you can do to make it legal.
If this is your only interest in radio, you are in the wrong newsgroup.
Now do you understand?

: I think your problem here, is thinking of ham radio as a way
: of extending the Internet. They are two separate mediums.
: Ham radio has nothing to do with the Internet, although wireless
: devices could be used as you suggest, that's not what the
: billions in spectrum is for. It's for radio communications with
: other like countries, using modes that Hams design or adopt.

Am I wrong in thinking ham radio is about a lot more than
communications with other countries? I thought it was
supposed to be about progress, not maintaining the status quo.

I'm under the impression that years ago, work in the ham
radio bands was often leading edge. For example, one old
ham friend of mine once told me that the first person who
managed to successfully bounce a signal off the moon to
communicate with someone a pretty good distance away (Virginia
to Hawaii, or something like that) was a ham.

: > That does bring up a good point (I think). If a ham operator
: > checks his e-mail through an amateur radio connection and
: > one of the e-mails is an unsolicited and unwarranted porn
: > spam, does that put him in violation?
:
: Yes.

I sure wouldn't want to check my e-mail, then. At least not
until the spam problem is brought under control, if ever.
Even with strong filtering, a not insignificant percentage of
porn spams keep coming through.

```

: I will spell it out again, very simply.
: What you wish to do is not legal.
: There is nothing you can do to make it legal.
: If this is your only interest in radio, you are in the wrong newsgroup.
: Now do you understand?

I think you didn't bother to read my previous post.

You didn't sell anything out. You just made an assertion with nothing to back it up. I don't even know exactly which issue or issues you are talking about.

Why don't you spell it out? What is illegal? What do I wish to do that is illegal? Why is it illegal?

I'd like to be able to connect to A&M via VPN. I am fully cognizant of the fact that you can't do that. But like I said, I wanted to ask anyway in case I was wrong.

There is still some limited, non-encrypted communications that would be useful. These would involve the use of telnet and one-time passwords. The objection seems to be some rather shadowy assertion of a problem with pecuniary interest. But where does the pecuniary interest come in since I am not an employee of Texas A&M University and have not been an employee of Texas A&M University since 1980, the connection would not involve any kind of payment in cash, goods, or services. I'm still waiting for a real answer on that with the rationale behind it.

I'd like to be able to check my e-mail via the radio link. But because of the possibilty of spam for porn sites being transmitted, I can't do that. So be it. That's not an issue any more, at least to me. However, I never thought about that before, so these discussions have definitely provided some useful information to me.

There are other things, too, that haven't been mentioned. But your assertion of what I wish to do seems to take in everything whether or not they've even been mentioned here.

For example, I'm very interested in robotics including issues concerning the cooperation between multiple, independent robots. I know that the rules specifically allow you to use amateur radio to control a model and so it seems clear that using it to control a single robot would be permissible. I have no idea if you can use amateur frequencies to allow two independent robots to communicate with each other, for non-pecuniary purposes, of course.

Correct. However, remember that encryption is a transformation made to obscure the content of the transmission, while compression is a transformation made to make the content of the transmission smaller (or otherwise more efficient). Although encryption is not allowed, compression is.

>I'm curious about what happens if you want to connect

Too bad. You'll have to find another radio service for wireless communication.

>I'm thinking of getting my license for the purpose of

Sounds like what you need is a wireless lan card, which operates under part 15, so no license is needed. Take a look at 47 CFR 15.247 specifically - one can use up to 1 watt and directional antennas (if point to MULTI-point, else the power must be reduced by an equation given in the subsection).

>What's the status on that? Are there any exceptions
>for cases when you really can't get around it?

I don't believe there will ever be an exception. It keeps spies out of amateur radio.

: keeps steering people the wrong way, otherwise this situation would not be
: so tiresomely familiar.

I haven't read any Linux FAQ's.

I have been familiar with HAM radio since I was in elementary
school as a result of knowing several people, including one
brother, who had their amateur licenses.

But I never was interested in it at all until I learned about
packet in the late 80s. At the time, I was the head of R&D
for a small, high-tech company that was quite short on money
and which eventually went bankrupt. Because of that, I didn't
have the cash to spend on anything that wasn't relatively
necessary. Besides, I had my first Internet account at the
time and was occupied with exploring the Internet. So I
didn't seriously look at amateur radio again until I started
seeing that it might be a worthwhile, but for computer
communications, not voice.

: Whatever the cause, the end result is a lot of time and bandwidth wasted
: here, explaining the same information over and over to people who are
: supposed to know how to find out things for themselves. Then they get

You need a FAQ. Then you can tell them to read the FAQ and then ask questions.

: arrogant and nasty when they are told that they are not exempted from the
: rules. It gets real old, real fast.
:
: Ham Radio has a lot to offer - if your primary interest is radio. If your
: main interest is not radio, then of course Ham Radio may not be relevant to
: those interests. That's the situation the FCC's PART97 rules are there to
: ensure when they define the hobby. Without those rules, this great hobby
: would soon cease to exist. Persons like yourself would gladly undermine the
: hobby in the cause of momentary expedience.

Like myself? You are already clearly stereotyping me as some
recent high school grad out to set the world on fire.

: It's nothing personal, it's just that you are a carbon copy of several
: hundred other guys who got the same "bright" idea in the past, and had to

Not hardly.

: precisely the same attitude I have. Oh, you'll be all sweet and light at

I've had worse. If you really want to have fun, try teaching
math to college athletes at a small university who are more
interested in playing football and goofing off than in studying.

Besides, I wouldn't be interested in chasing them off. From
everything I've heard and seen, I suspect that some of them
might be exactly the type that amateur radio needs.

And, for what it's worth, back in my undergraduate days, a fair
number of the brightest computer science students had their
amateur radio licenses before they graduated. They weren't
out to subvert amateur radio.

: first, but give it a little time.. You'll see what I mean. Give it a little
: time, then imagine several years of it.

That's one of the nice things about FAQs.

I have a question for you.

Considering that packet radio (i.e. pre-ham packet radio) was
such a fertile ground for learning how to do networking, why
does it seem that little of the innovation in using radios for
computer communications is being done by the ham radio community?

I'm really puzzled by that.

I wondered about that.

Also, one method of keeping your password from being
stolen while logging onto a system with telnet and/or
ftp is to use a one time password or set of passwords.
Since that is designed to obscure your password in a
manner of speaking, would that be considered to be
encryption for the purpose of obscuring the content?

If by "progress" you mean setting aside the FCC regs for your own personal
convenience, then the answer is no, ham radio is not about "progress".

>

"If I do not get my way, the grapes must be sour... Ham Radio must have
really gone downhill."

Did those moonbounce experiments involve breaking the law, or circumventing
the FCC regs? Nope.

Was it all done to benefit a single college student who is either too cheap or too stupid to do his work correctly? No again.

Try to keep in mind the fact that it is only you who sees yourself as the center of the universe. To everybody else, you're just some whiney jerk who is out to see what he can get away with. Dime a dozen material. About as unique and special as a beer fart on Saturday night.

Do the instructors and administrators at A&M know what you are up to? Are they aware of the way you have disrupted this discussion with off-topic whining about wanting to bend the rules? Do they know that you throw little temper tantrums when you don't get your way, and go around insulting people when you don't get the answers you wanted?

If not, that can easily be remedied with a few phone calls and e-mails to the IT department there at A&M.

Charles, N5PVL

>
> The objection seems to be some rather shadowy assertion of a problem with pecuniary interest. But where does the pecuniary interest come in since I am not an employee of Texas A&M University and have not been an employee of Texas A&M University since 1980, the connection would not involve any kind of payment in cash, goods, or services. I'm still waiting for a real answer on that with the rationale behind it.

Eric,

All universities have acceptable use policies, and they have a fee for service. It might be included in the tuition, or could be listed as a lab fee, or computer fee. It is not free to the students. It is a major investment by the university, and must be secure from theft or abuse. I know of no university which would allow a student to extend their network to amateur radio. They used to allow that many years ago, when their networks were not the major investment they are now.

This fee for service is the pecuniary interest. You are using a commercial service (schools are just as commercial as AOL, but may be cheaper) that you merely pay money to use.

Ham radio, being a hobby, cannot interface to commercial entities.

If you were to use a university network to tunnel between two amateur radio stations, than this would be legal, as there is no link to the internet. Hams do have networks that connect to the Internet, but they are responsible for all data that enters the ham radio bands. Anything that is illegal is subject to a fine and loss of privilege.

Ham radio is a radio hobby. It has no limits. However, it cannot be interfaced to commercial systems willy-nilly. Take the telephone example you used. Hams use autopatch devices for emergencies, and they also use them for fun. They must limit how these interfaces are used. You couldn't call a phone sex company, a pimp, or a drug dealer. Same with the Internet. You can connect ham radio to the Internet, but you are then responsible for all relay, and to make sure it isn't just a replacement for AOL.

Ham radio is leading edge in many things. Take the software defined radio. Where can you buy one commercially? There's a new modem designed almost every week that uses a sound card. How many commercial companies do that? Depends on what you mean by leading edge I guess. Connecting to the Internet is not leading edge.

Eric,

If you read my post carefully, which you did not. This issue would have to be decided by the FCC Legal Consul Mr. Hollingsworth and in light of his recent group of Notice of Violations covering such violatoins as alternator whine on a signal and people using 146.520 too much, he might considered it to be commerical.

Another point is what kind of activity is attending college? Those who attend college pay a fixed sum of money to receive a fixed amount of credits toward a degree for a predetermined amount of expended labor. Sounds like a commercial activity to me but then again I am only an MSEE, so I would not understand that kind of high level thinking, like someone with a PhD.

You are so typical of people on the internet who are quick to citizen with your view of reality that you never see to the big picture. Sorry, to insult your intelligence with my dribble but, after several years of spending time deal with FCC regulatory issues at a radio common carrier it made sense to me. Remember the FCC is just like your local Cops in that they make money by

```
issuing tickets.

I spent 5 years work communications in the DC area and the saying out there
was "Money Talks and Bull Shit Walks", so you go figure how they will rule.

3's to ya good bud.

Hey..
I have been wondering about this. 900 ft?
In the Boston area people are excited about the
coverage of the Boston repeater. I believe that
this 2 meter machine has the highest installed
antenna ontop of 30(approx) story building. The
coverage can reach NJ and PA or Nova Scotia to
the north. This is quite an area.

How do you even physically get something at
900 ft either? I assume that this isn't a typo
as you said 400 feet for APRS!

Bill

Have a look at http://www.timewave.com in the Amateur section - there is
an upgrade but it is expensive and only available direct from Timewave.

Regards

Ray

: Eric,
:
: All universities have acceptable use policies, and they have a fee
: for service. It might be included in the tuition, or could be listed
: as a lab fee, or computer fee. It is not free to the students. It is
: a major investment by the university, and must be secure from
: theft or abuse. I know of no university which would allow a
: student to extend their network to amateur radio. They used to
: allow that many years ago, when their networks were not the
: major investment they are now.

They would not allow the network to be opened up to just anyone
that is using amateur radio. In fact, anyone not authorized by
the University to connect to the network would be in violation
of the Texas Penal Code.

They do permit some kinds of traffic that may be in the clear
as long as the passwords to the accounts are not divulged. They
do this with the use of one time passwords that change with
every login.

But they do allow you to use a VPN to include your own computer
as part of the network. This is secure and permissible. For
many things, it may be the only acceptable method of access.

For example, while I can telnet into certain servers and
use a one time password (actualy 6 of them with each login),
I would only have direct access to that machine. If I needed
to connect to other machines from there, that would involve
transmitting the username and passwords for those other
machines in the clear. And that is not acceptible.

For those who live close enough, they also have their own DSL
service that allows students, faculty, and staff direct access
inside the firewall. By the nature of the transactions involved,
I readily concede that this is very likely a commercial service.

When abiding by their rules, as I have always done and will
always do, there is little threat of abuse and there is no
way that I would use the connection for any kind of theft.

By the way, I believe that quite a few students do use the license-free services to tie their computers to the University network. For example, many students have set up wireless networks at home. If a student creates a VPN connection from one computer in the house and uses wireless to tie another computer to the computer with the VPN connection, that is exactly what you would have.

Another possibility would be for someone with the Texas A&M DSL connection to connect a wireless access point to the modem so they could access the network from anywhere in the house or apartment.

I haven't heard of any prohibitions on this practice. I asked a similar question a couple years ago and got a response that the student is held responsible for whatever comes through his connection.

: This fee for service is the pecuniary interest. You are using a
: commercial service (schools are just as commercial as AOL,
: but may be cheaper) that you merely pay money to use.

I think that for this to be a commercial activity, the purchase of the service would need to be voluntary on the part of the purchaser and seller. But the fee is charged to every student whether or not they ever use the computer networks. It is quite possible, especially in some of the liberal arts, that a student could earn a bachelor's degree without using any computing resources at the university. But he would still be required, as a student, to pay the fee.

: Ham radio, being a hobby, cannot interface to commercial
: entities.

How about using a telephone patch to place an order at a restraunt? Isn't that permissible? A restraunt is, of course, clearly a commercial entity by any interpretation.

Yeah. I know that it is a specific exception that has been clearly spelled out, but I just wanted to point out that there are exceptions.

: If you were to use a university network to tunnel between two
: amateur radio stations, than this would be legal, as there is no
: link to the internet. Hams do have networks that connect to the
: Internet, but they are responsible for all data that enters the
: ham radio bands. Anything that is illegal is subject to a fine and
: loss of privilege.

How do they connect to the Internet? Does someone at some point pay for the local connection? It would seem that just about any open or semi-open access to the Internet would involve a commercial entity at some point. If the local club pays for the access does that make it non-commercial? So how do the networks connect to the Interet without someone paying for the connection? Or does someone else pay the connection fee in order to get around the rule?

So the argument is that because there is a computer fee, that makes it commercial and thus of pecuniary interest? That is an interesting argument, but I'd certainly want to hear the the FCC's opinion on whether or not it is a commercial service. I find it very difficult to imagine that they would argue that.

By the way, I appreciate receiving a serious response to the question. Thanks.

Eric Johnson

FOR SALE:

Yaesu FT-2 Auto in near mint condition.
144 - 148 MHz Vintage FM.
Includes original manual. This rig sparkles.
Power output is 10 Watts or 1 Watt.
Dimensions: 210 mm wide X 95 mm High X 270 mm deep.
Made tough like a battleship. Lots of steel and chrome.
Has a nice tilt-bail and unusually nice chrome front.
Built in AC supply for 120V AC.

Present configuration includes crystals for -
145.07 Packet
145.09 Packet
146.52 Simplex
146.16/.76
146.34/.94
146.37/.97

Supplied with an interface cable made for running packet radio also.
Available for $55.00 plus shipping

E-mail me to arrange purchase or request pictures etc.

Hi Graham,

That is the one.   Next time around I am not going to get old and forgetful.
Thanks,

Bert

Thanks Don. that does seem to change the speed, but not the tones or modulation. hbaud is not in the manual so it probably wasn't meant to be used. I want to do standard 1200 baud stuff that's compatible with my other TNCs.

First make sure that are not already built into the MFJ1278. Sometimes
a jumper is changed to put in circuit the resistor and cap. If not
then choose a 4.7 K ohm resistor 1/4 watt and a 0.47 microfarad non
polorized cap. Should work fine. What Icom Handietalkie have you got ?

Hi,
Does anyone know how the up/down fuction works on Icom handhelds? This is the simple up/down function of the memories that you woud do with the remote mic/speaker HM-75A. It works off of the ring sections of the 2.5mm and 3.5mm plugs, I think. A radio that would use this is the Icom IC-T2H or most of the handhelds.

Thanks!

Steve

THe IDR-96 is a 9600 bps only TNC. It cannot do 1200 bps. Essentially, it is a re-packaged PK-96 with the option of adding a 440 - 450 MHz Tekk transceiver internally.

In 1996, AEA anticipated a viable commercial market at 450-470 MHz and a solid ham market at 440 MHz. Unfortunately, 2 to 5 watts, crystal control, 9600 bps only and $500.00 was not a winning combination (especially if you can't place it on a nearby mountain). Having said that, the IDR-96 does work well if you work within its specifications. We still sell it commercially.

The PK-900 supports Pactor and does have memory ARQ using an A/D converter.

Incidentally, we will be shipping a new sound card interface upgrade kit for
the PK-900 about Dec. 15 - 20.

thanks Randy. I'll keep hoping they open a local 440 9600 user packet node.
I'll use some other gear for my current project.

Hi everybody.
I've completed the development of a new HF SSB/CW transmitter. It covers all the HF amateur bands, WARCs included, with a 10Wpep output power, and features an FPGA based SSB/CW digital synthesizer running at 90 MSPS. Something really new, hopefully.

Anyone interested on the subject will find some pictures, along with preliminary informations (still in italian language, sorry) and tech specs at the following address:

http://www.microtelecom.it/digimit

I'll provide detailed infos in English language asap.
Please, stay tuned.
Best 73s de nico, IV3NWV

Yes, of course. Beeing Digimit just a transmitter, I really don't know
if it will encounter some favour among the amateur community, but I hope it.

Actually I'm working to complete some engineering details and the
project documentation (technical manuals, bill of materials and other
amazing things). Expect to see many news on the next days.

Try a search on "winlink".  Latest version 2.9 handles all
modes  amtor/pactor/packet/g-tor etc.

One of my students characterised 3 or 4 soundcards, they all differ in their frequency response, even with "tone control" levelled or turned off and "mic AGC" I wouldn't be too sure of where the cards came from, only one was a well known make. I don't have the graphs to hand but there were not too bad at 1KHz. At 300 Hz performance was very variable. Be careful to calibrate your own card!

We hacked together a circuit to measure DC by "modulating" a 1KHz tone and this worked fine over a small range of volts.

```

Well Nico, your concept is appreciated in the following discussion.
But the receiver is missed. Do you have any planning for a receiver
for this TX ?

Well,
digitally speaking, a receiver is more complex than a transmitter.
If in a transmitter a 60/70 db dynamic range is excellent, an HF
receiver requires something better, say 140 dB.
That's why I thought it was worth starting with a transmitter design.

The receiver... uhm. Let me toy some more time. We are still in 2002.
Today's monolithic ADCs are not as good as they should for direct
sampling communication receivers.

We need little stones to make big walls.

I'm on holiday in Australia, I have just bought a laptop which has windows 98 on it and I have my Kodak DX3215 digital camera with me, I cannot get win98 to work with it. I have the USB cable with me and it works fine on my brothers PC which has XP on it, windows 98 device manager lists it but it has a yellow exclamation mark against it. I have tried the Kodak website but not found any Win98 drivers for it. Does anyone know where I can download the windows98 drivers for it ? I have not got my installation cd with me, was not thinking about laptop until I came over here. Any help appreciated. I'm using my brothers PC at the moment so you can drop a reply to him or just leave a reply here and I will check back later.

Thanks

Adam.

Hello everyone!

I'm a relatively new ham. I was intrigued by the many aspects of the hobby. I'm really keen on packet and other modes. I would like to find out if anyone uses it for a reasonable speed in the Massachusetts area. I personally think 1200 baud is too slow for any work. The hardware is out there for cheap and faster modems with todays technology. 9600 baud seems definitely plausible in FM modulation. Is any one doing it in Eastern Massachusetts?

I would also like to voice my opinion on emergency communications. Does anyone think packet would actually work in dire straits? What happens when the digipeaters go down? Are you going to do HF packet at 300 baud? The slow speed has me nervous. I know people that type faster than HF packet. It would seem much faster. I got to get some answers so please post some followups.

Bill

Howdy, Bill!

The packet group in your area is: http://www.northeastflexnet.org/
Northeastern States FlexNet Network.

They have maps on the home page that show what's currently available and at what speed. The contact person for that group can be of a lot of help to you.

As far as speed goes, there is a lot of controversy about that. I will note here that the really big, successful packet radio emergency networks normally run 1.2kb access with 9.6kb links between the nodes. There are faster links here and there, but the bulk of the work is currently performed on links as I described above. These folks have a great record of service, so it appears that slow/medium speed links can be quite useful for emergency communications.

What you will discover about higher speeds than 9.6kb is that hams seldom go to the additional expense and trouble associated with using them. The equipment is out there, and it can be done at a fairly reasonable price, but not many hams go far beyond the "talking" stage with high-speed packet. It happens here and there, but not on what you would call a widespread basis.

If you are really good at understanding what makes a radio tick and have a service monitor on hand, high-speed packet is a snap. If you are not a radio guru, you will encounter more difficulty and will have to spend more money. Most hams are not ready for that, which goes far in explaining why high-speed packet is not more popular than it is.

The FlexNet network in your area has some high-speed links, but I do not know if they are accessible from your particular location. Ask the guys at Northeast FlexNet Networks, they'll know.

Additional information about packet radio and packet radio networks can be found at:

http://www.uspacket.net USPN Website.

Has anyone here successfully connected a Rigblaster to a QRP+, whose only input is the mic signals through a 1/8" stereo plug?

If so, tell me about your experiences and how you wired the interface cable.

Thanks,
Paul   AA1MI / HB9DST

Gee I could see possably modifying the output of such a device to operate on
a ham band and using it as the basis for a HIGH speed packet backbone!

Thanks for the links.

I'm intrigued by Flexnet. I see
that is very popular in Europe.
I was looking at a flexnet website
over there too. I just found this
much more cutting edge. I saw some
statements about AX.25 was not
compatible with TCP/IP. I thought
they were.

Is Flexnet compatiable with anything?
So I guess that I can going to have
to run flexnet. I will need another
modem and radio to do packet so
I can connect to any local packet nodes?

bill

Hi Nico,,

in a german Ham-Magazin (Funk) has been a report that showed a digital RX
from 10kHz to 30MHz build by HB9CBU.
So he did just the other part first :-)
Unfortunately there is no Internet-Adress :-(
But you can find his email-address at qrz.com

Will you be releasing the source code (VHDL or Verilog)?
This could be an interesting part of a software-defined radio system.

Does anyone know where the backup battery is located in the Icom IC-45? The manual doesn't show where it is, and I can't spot it by taking the covers off.

Many thanks.

Nah, nah, nah. You can run TCP/IP on top
of ax25. You can use either sv2agw(search for
this on the net to find it) for Windows, or
Linux or one of the (j/x/mf/whatever)nos programs
to do this.

Maybe Flexnet is better? Here in northern California,
we have a lot of inertia in the older AX25 stuff. A lot
of the sites are little z80 boxes on hilltops, I believe.
I'm not sure what the low power/low cost node options for
flexnet are.

I would be glad to read it, even if I don't understand almost a single word of German.

How good is HB9CBU's receiver? What about its blocking or third order intermodulation dynamic range? Is it as good as a top class receiver?
Please, let me have a copy of that Funk magazine.
I wouldn't like to reinvent any wheel, or reel, SMD speaking ;-).

Tnx fer info and
warmest 73, de nico - IV3NWV

:of the sites are little z80 boxes on hilltops, I believe.
:I'm not sure what the low power/low cost node options for
:flexnet are.

It seems not to be too inexpensive to me.
I figure the cost of a tower and antenna
and a shack to store it all at a remote
site would be expensive. $100 for an
old laptop is going to make a dent in
the budget. :)

Right now I want to connect to the nodes out there. I've done a little packet and connected to K1EA's dxcluster. What else is out there? I went to my local club and they have a packet node going. I'm going to connect to it as soon as I have my own packet setup.

I'll throw in a few cents here...

The question becomes: what would you do with the speed if you had it?

That's always a tough one. Whatever speed you choose, the users are apt to consume it, or worse, under-utilize it.

I did a link with another Ham (since deceased) where we set up a JNOS link using PackeTwin cards. Alas, the PackeTwin drivers or the hardware always seemed to lock-up after a few hours, but we found that a 9600 baud circuit with 512 byte packets, and ax.25 segmentation mode, was good enough that we killed the Unix 2400 baud uucp dial-up link we had. If it wasn't for the lock-up problems, that speed was good enough to transfer huge FTP files.

But then he decided he wanted to use it as a netrom gateway, which linked-in 2 meters. This dropped the throughput so low as to make it boring, and I pretty much gave up and went back to 1200 baud and 2 meters.

My own opinion, after watching it for hours, is that 4800 baud is the ideal speed. That's what our police and fire departments use, and there is so much data flying that I couldn't keep up with all of it. It's far better than any "node" systems Hams have used since the beginning of packet. I also think 4800 baud is a good speed for voice codecs, with the advanced vocoder chips that are out there now.

Say that your hometown of the USA is evacuated due to the terroist strike at the nuke plant. All of the children are sent to the host communities. 1200 Baud would not cut sending list of children to the net control. Net control would spend a long time waiting to figure out where every kid was.

I'm also used to the internet and before its popularity. I was using BBS's on dialup as well. I used to swear at the 14.4 modem. I will never go less than a 56 external and these get me a mere 53 KB at best.

I was getting the impression that netrom was a fast protocol. I'm not very familar with this, tho. You were doing 9600 on 70 cm?

Bill

I think FEMA should be responsible for that, and not volunteers. I send over $30k to the Feds every year, so I expect them to take care of it. I'm hoping their not sending it all to North Korea to keep them in fuel oil and free nuclear power plants.

> I was getting the impression that netrom was a fast protocol. I'm not very familar with this, tho. You were doing 9600 on 70 cm?

Yes, 441.925 half-duplex point-to-point. No, netrom was designed for small packets and multiple connections. Both of which are the enemy of speed. At the time I tried to get others interested in the point-to-point idea, but there were too many people who were highly invested in whatever they were doing with netrom and BBS nodes. They thought every 2 meter frequency should be connected to every other 2 meter frequency, and of course used a common UHF frequency to do it. That was their fun, and who was I to want to change it :-) I wrote an article for the club paper, but it was rejected as too costly an idea, and no one would be interested.

Thus, when people say they want speed, I ask them, how much are you willing to spend to set up your community. That is, you will have to design and fund it yourself. But they can offer you tower sites and advice after you get it all worked out.

I laught about this. You seem to be right, but it doesn't seem
to be that way. The DOD is paying the freight for things as I
understand and not FEMA. As I gather FEMA is actually very limited.
The DOD is paying for EOCs and hams to organize communications.

FlexNet is the most advanced packet radio software available to hams right now, custom designed to get the most possible utility from a ham radio digital link. It's designed specifically for use with radio, and you can really tell it when you experience the performance difference between FlexNet and the old-style stuff. (Net/Rom, TheNet, ROSE, FPAC, etc..) It just works better.

Some hams think of tcpip as being obnoxious over an AX25 link, because tcpip is a bit of a channel hog, but with FlexNet this is not as big a problem as it is with the old-style stuff. There are two major FlexNetworks, one in the northeastern U.S., and one in Europe. In both networks, amateur tcpip is quite popular and nobody appears to be complaining. This has brought amateur tcpip into mainstream packet again, where it belongs.

>
> Is Flexnet compatiable with anything?
> So I guess that I can going to have
> to run flexnet. I will need another
> modem and radio to do packet so
> I can connect to any local packet nodes?

FlexNet is advanced AX25. It's compatable with just about everything currently in use, and you do not have to have a FlexNet setup at home in order to be able to use FlexNet network. You will get better performance if you use FlexNet, but without it, you are still functional and can enjoy the network. Any old TNC and software should basically work.

There are soundcard packet versions of FlexNet for DOS, and just about any variety of Windows if you do not currently own a TNC.

The best setup though, IMHO, is a TNC2 (MFJ-1270c for example) with FlexNet's "6-Pack" EPROM image plugged in. This gives you bulletproof, high performance and it is easy to set up. Almost all FlexNet nodes in the U.S. use "6-Pack" TNC's. I use it at home with Flex32 (the Windows version) and it is absolutely reliable.

Hope this is helpful!

It's kind of over-kill if you only have two or three people
to QSO with though. Lately I've been using UI-View
to chat, as there are more digipeaters on the APRS channel.

Hi William

Take a look at www.tvipug.org - we have a very good 9k6 modem and the new Windows beast (IPRI = Internet Protocol Radio Interface) is now very close to production. Expect to see something about the $50 mark early next year.

I suppose I should release it.
And I'll do it if some cooperation will aggregate around SDRs.

We have a group here in S. Texas that does the same thing, and are having
fun with it. We have more APRS digis than packet nodes here too.

We tend to put our packet nodes up at 900 ft. so they be accessed throughout
most of the lower Rio Grande Valley. Because of that, not many packet nodes
are really necessary here. The land is as flat as a billiard table, and the
ground water is salty. (Perfect ground) - So we get good coverage.

APRS is a different thing. I've noticed that the APRS digis here tend to be
100-400 ft. up, and there are a lot more of them. We have our APRS system
tied in to the NWS bunker in Brownsville. In the old TexNet days, we had
regular packet tied into the NWS center too, but that was shut down back in
the 90's, when TexNet started to go away.

Don't you guys still have a good ROSE/FPAC network in your neighborhood? I
always liked that network better than TexNet. It was faster, and could do
more.

Charles, N5PVL
